Time allowed: 1 hour 30 minutes

Instructions

- Use black ink or black ball-point pen.
- Fill in the boxes at the top of this page.
- Answer **all** questions.
- You must answer the questions in the spaces provided. Answers written in margins or on blank pages will not be marked.
- Do all rough work in this book. Cross through any work you do not want to be marked.
- Show the working of your calculations.

Information

- The maximum mark for this paper is 80.
- The marks for questions are shown in brackets.
- You are expected to use a calculator where appropriate.

Answer **all** questions in the spaces provided.

- 1 Julie decided to make use of her knowledge of nutrition while training for a long-distance running race.

The evening before the race, she ate a meal of wholemeal pasta with cheese sauce. She knew that this would provide her muscles with the energy that she would need the following day.

During the race Julie's muscles used energy released from the pasta. This energy was used to phosphorylate ADP, forming ATP. Phosphorylation occurs during both aerobic and anaerobic respiration.

- 1 (a) (i) Describe what happens to ATP during muscle contraction.

.....

.....
(2 marks)

- 1 (a) (ii) Write down a balanced symbol equation that represents aerobic respiration.

.....

(2 marks)

- 1 (a) (iii) Compare the amounts of ATP produced by aerobic and anaerobic respiration.

.....

.....
(1 mark)

- 1 (b) In the table below, put ticks (✓) in the appropriate boxes to show in which of the respiratory pathways the processes given take place, and crosses (x) where they do not.

Pathway \ Process	Glycolysis	Krebs cycle	Electron transport system
ATP used			
Carbon dioxide produced			
ATP generated			

(3 marks)

1 (c) Cells can make use of lipids and proteins as well as glucose to produce ATP.

1 (c) (i) How do lipids and proteins enter the respiratory pathways?

.....
.....
.....
.....

(2 marks)

1 (c) (ii) People suffering from anorexia nervosa greatly restrict their intake of food.

Suggest why people who suffer from anorexia nervosa are at high risk of suffering heart failure.

.....
.....
.....
.....

(2 marks)

2 A surgeon carried out a biopsy on a three-year-old child who was failing to grow or to gain the weight expected for his age. A small sample of tissue was removed from inside the child's intestine.

The diagrams below show the appearance of the villi in the child's intestine and that of a normal, healthy child of the same age. Both diagrams are to the same scale.

Healthy child

Child patient

2 (a) (i) What differences are visible between the villi of the healthy child and that of the patient?

.....
.....
.....
.....

(2 marks)

2 (a) (ii) Describe and explain **two** other features of a healthy intestine that help to maximise the absorption of digested food.

Feature 1

.....
.....
.....

Feature 2

.....
.....
.....

(4 marks)

2 (a) (iii) Use the diagrams on **page 4** to help you to explain why the patient was failing to gain weight as expected.

.....
.....
.....

(1 mark)

2 (b) The three-year-old child was diagnosed as suffering from coeliac disease. This is a condition in which an individual lacks a particular enzyme needed to digest gluten. Gluten is a protein found in wheat. A dietician was asked to advise the family on a suitable diet for the child. The child’s parents found it hard to understand why the child could digest proteins such as meat but was unable to digest gluten.

How might the dietician have explained this to them, using his knowledge of enzymes?

- 3 In an experiment to investigate the effect of the presence of bile on the activity of lipase, a student set up three tubes, **A**, **B** and **C**. The contents of the tubes are given in the table below.

	Milk added (cm ³)	Bile salts added (cm ³)	Lipase added (cm ³)	Water added (cm ³)
Tube A	10	5	0	2
Tube B	10	0	2	5
Tube C	10	5	2	0

All three tubes were incubated at 40°C for one hour. At 20 minute intervals, the pH values of the contents of the tubes were measured and recorded. The results are given in the table below.

	pH of contents during incubation			
	at start	after 20 minutes	after 40 minutes	after 60 minutes
Tube A	8.3	8.4	8.3	8.3
Tube B	8.3	7.5	6.5	6.5
Tube C	8.5	7.0	6.5	6.5

- 3 (a) What evidence is there that lipase activity is increased by the presence of bile salts?

.....

 (2 marks)

- 3 (b) What is the function of **Tube A**?

.....
 (1 mark)

3 (c) Give **two** possible explanations for the results in **Tube C** at 40 minutes.

1

2

(2 marks)

3 (d) (i) How could this experiment be changed to improve the accuracy and precision of these data?

.....
.....
.....
.....
.....
.....

(3 marks)

3 (d) (ii) How could this experiment be changed to improve the validity of these data?

.....
.....
.....
.....
.....
.....

- 4 An 18-year-old student suffers from cystic fibrosis. This condition causes the mucus produced by her body to be unusually thick and sticky.

She regularly attends a clinic where a nurse monitors her lungs in order to assess how effectively her blood is being oxygenated. A pulse oximeter is used to determine the oxygen saturation of her blood at different partial pressures of oxygen.

The table below gives the results of her test. Also shown are the results for a person who does not suffer from cystic fibrosis.

Partial pressure (O ₂ /mmHg)	% saturation of blood with oxygen	
	Sufferer	Non-sufferer
20	8	38
40	22	80
60	60	95
80	64	100
100	64	100
120	65	100

- 4 (a) (i) Cystic fibrosis affects oxygen transfer into the blood.

Use the data in the table to describe **two** of these effects.

Effect 1

.....

Effect 2

.....

(2 marks)

- 4 (a) (ii) Blood of a non-sufferer normally contains 20 cm^3 oxygen per 100 cm^3 at a partial pressure of 80 mmHg.

Calculate how much oxygen there will be in 100 cm^3 of the sufferer's blood at the same partial pressure.

.....
.....
.....
.....

(2 marks)

- 4 (b) The abnormal mucus also coats the inside of the digestive system. Cystic fibrosis sufferers must always take enzymes with their food.
Why is this?

.....
.....
.....
.....
.....
.....

(2 marks)

Question 4 continues on the next page

Turn over ▶

- 4 (c) Cystic fibrosis occurs as a result of a fault in a gene. This results in sufferers losing large amounts of salt from the body. The nurse explains the short-term and long-term consequences to the body of this loss of salt. The nurse emphasises that the lost salt must be replaced.

What information about the long-term and short-term consequences of lack of salt in the body should the nurse include in her explanation?

.....

.....

5 An elderly man was taken by his daughter to the Accident and Emergency department of their local hospital. He was experiencing extreme difficulty in breathing. The tips of his fingers and his lips were cyanosed (a blueish colour).

The doctor diagnosed emphysema. This is a condition in which the walls of the alveoli are damaged and weakened.

5 (a) (i) Use the diagrams to describe how emphysema affects the size and number of the alveoli.

.....

.....

(2 marks)

5 (a) (ii) Explain why these changes significantly reduce the amount of gas exchange that takes place at the alveoli.

.....

.....

(2 marks)

5 (b) A team of scientists used scans to examine the lungs of three groups of people. One group had severe emphysema, the second group had mild emphysema and the third group had no signs of the disease. The table below shows some of their data.

	Without emphysema	Mild emphysema	Severe emphysema
Average total lung volume (cm ³)	4772	6232	6275
Average lung weight (g)	1019	1104	810
Average measured surface area (m ²)	118	97	30

5 (b) (i) Calculate the percentage decrease in surface area experienced by a sufferer of severe emphysema compared to what they could expect if they did not have the disease.

.....
.....
.....
.....

(2 marks)

5 (b) (ii) Using these data, together with your biological knowledge, write a paragraph that could be included in a booklet produced by the NHS that aims to inform people of the effects of emphysema on the functioning of their lungs.

- 6 A fitness instructor was carrying out an induction session with a new client of her health club. Part of the instructor’s role was to ensure that the clients understood the reasons for certain recommendations.

The instructor stressed the importance of maintaining hydration during exercise and showed her client a chart listing the ways in which the human body gains and loses water over a 24-hour period. The chart is shown below.

Route	Water gained (dm ³)	Water lost (dm ³)
Drinking	1.45	0.00
Food	0.80	0.00
Metabolism	0.35	0.00
Exhalation	0.00	0.40
Sweat	0.00	0.60
Urine	0.00	1.50
Faeces	0.00	0.10

- 6 (a) (i) Other than eating or drinking, give **two** of these gains or losses that would be expected to increase during strenuous exercise.

1

2 (2 marks)

- 6 (a) (ii) Assuming that the client has a skin surface area of 3 m², what is the approximate rate of water loss by sweating per hour from each m² of skin? State the correct unit in your answer.

.....

.....

.....

.....

Answer (3 marks)

6 (a) (iii) What assumption did you make about the skin when you worked out your answer to part (a)(ii)?

.....
(1 mark)

6 (b) The client commented that even though she drank an extra 500 cm³ of fluid while she was exercising, she had not needed to urinate.
The instructor explained that this was due to the action of a particular hormone.

Explain, by naming the relevant hormone and describing its action, why the client had not needed to urinate while she was exercising.

- 7 A school nurse was carrying out a health check programme with some 15-year-old pupils. One of the girls appeared pale and rather thin. She weighed 42 kg and was 158 cm tall. When the nurse talked to her, the girl said that she often felt tired and lacked concentration.

Over the next month, the girl kept a diet diary, in which she recorded everything that she ate. The nurse then helped her to work out the average amounts of energy, protein and some of the important vitamins and minerals that she was eating each day.

They then compared these figures to the expected recommended daily allowance (RDA) for a girl of 15. These data are given in the table below.

	Energy (kJ)	Protein (g)	Vitamin A (μg)	Vitamin C (mg)	Vitamin D (μg)	Iron (mg)	Calcium (mg)
RDA	9000	53	750	60	10*	15	1200
Girl's intake	7200	56	800	180	0	6	1400

* during winter months only, otherwise 5 μg

- 7 (a) (i) What changes to the girl's diet should the nurse recommend in order to help her feel more energetic?

Change 1

Change 2

(2 marks)

- 7 (a) (ii) The diary revealed that the girl ate plenty of fruit, and a lot of low-fat yoghurt. What is the evidence in the table that supports this?

.....

.....

(2 marks)

- 7 (a) (iii) Why does the RDA for vitamin D specify during winter months only?

.....

.....

(1 mark)

7 (b) A few months later the girl visited the nurse again for a review session. She had gained some weight but was still very pale and did not feel any more energetic.

The nurse decided to refer her to her GP for a blood test.

7 (b) (i) The doctor decided to ask for a haematocrit test.

Describe what the doctor could have said to explain how the test would be carried out, and what the results would show.

.....

.....

.....

.....

.....

.....

(3 marks)

7 (b) (ii) The blood tests also showed that her haemoglobin level was 10 g dl^{-1} . What is the normal haemoglobin level for a girl of 15?

.....

.....

(1 mark)

7 (b) (iii) What is the name given to the condition in which a person has an abnormally low haemoglobin level?

.....

(1 mark)

- 8 (a)** A young man was visiting the dentist. He had very bad tooth decay. Two molars had to be removed and he needed several fillings. After the treatment, the dental hygienist explained why and how he should maintain good dental hygiene.

What would the dental hygienist say?

.....
.....
.....
.....
.....

(3 marks)

- 8 (b)** The loss of the two molars would affect the young man’s ability to process food in his mouth.

Use your biological knowledge of the functions of teeth to explain why having two molars extracted affects his ability to digest and absorb food.

.....
.....
.....
.....
.....
.....

(3 marks)

8 (c) The young man admitted that he rarely brushed his teeth because he had learned during his Applied Science course that the mouth is able to keep itself clean. This is true, so why do you think that his teeth had decayed so badly?

.....

.....

.....

.....

(2 marks)
