BYA6

General Certificate of Education June 2007 Advanced Level Examination

# ASSESSMENT and QUALIFICATIONS ALLIANCE

## BIOLOGY (SPECIFICATION A) Unit 6 Physiology and the Environment

Tuesday 19 June 2007 9.00 am to 10.30 am

#### For this paper you must have:

• a ruler with millimetre measurements.

You may use a calculator.

Time allowed: 1 hour 30 minutes

#### **Instructions**

- Use blue or black ink or ball-point pen.
- Fill in the boxes at the top of this page.
- Answer all questions.
- Answer the questions in the spaces provided. All working must be shown.
- Do all rough work in this book. Cross through any work you do not want to be marked.

#### **Information**

- The maximum mark for this paper is 75.
- The marks for questions are shown in brackets.
- You will be marked on your ability to use good English, to organise information clearly and to use accurate scientific terminology where appropriate.
- You are reminded that this test requires you to use your knowledge of Modules 1, 2, 4 and 5 as well as Module 6 in answering synoptic questions. These questions are indicated by the letter S.

### Answer all questions in the spaces provided.

1	(a)	Name and describe the process by which salivary amylase digests starch into maltose.
		Name
		Description
		(3 marks)
	(b)	Salivary amylase does not digest starch in the acid conditions found in the stomach. Explain why.
		(2 marks)

Turn over for the next question

S

2	(a)	What is
		a taxis,
		a kinesis?
		(2 marks)

S (b) Woodlice are small animals. They are frequently found under rotting logs where conditions are dark and humid. Some students investigated the response of woodlice to light and humidity. They placed 20 woodlice in a choice chamber with the following conditions in different areas of the chamber.

Dark and moist

Dark and dry

Light and moist

Light and dry

They recorded the number of woodlice present in each of the areas after ten minutes. The results are shown in the table.

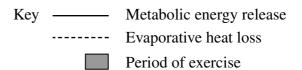

Trial	Number of woodlice in each condition after 10 minutes				
ITIAI	Dark and moist	Dark and dry	Light and moist	Light and dry	
1	12	3	4	1	
2	11	4	4	1	
3	9	3	5	3	
4	14	2	4	0	
5	14	2	2	2	
Total	60	14	19	7	
Mean	12.0	2.8	3.8	1.4	

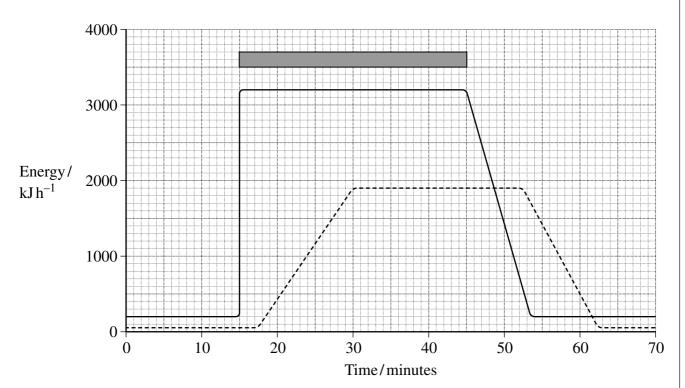

The students carried out a  $\chi^2$  test on the results. They tested the null hypothesis that there is no significant difference in the distribution of the woodlice.

(i)	Against how many degrees of freedom should they check their value for	$\chi^2$ ?
		(1 mark)
(ii)	They found that their value for $\chi^2$ was greater than the critical value for appropriate number of degrees of freedom for a probability (p) of 0.05. conclusion should they draw from this?	
		•••••
		(2 marks)

Turn over for the next question

**3** The graph shows the changes in metabolic energy release and evaporative heat loss by a person during a period of exercise.

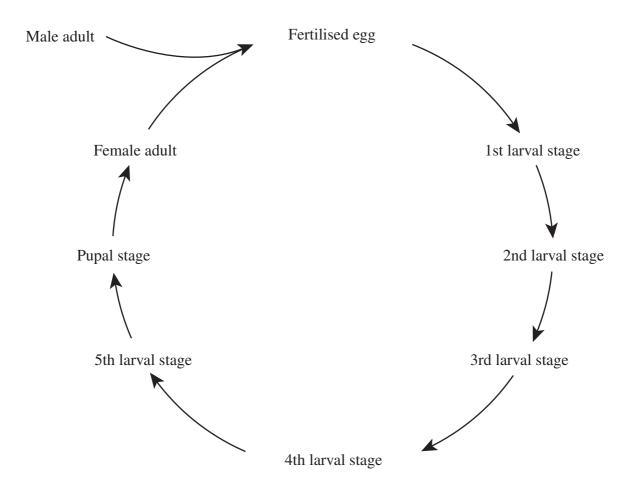

(a) Calculate the total extra metabolic energy released during the period of exercise. Show your working.

(b)	(i)	Explain what caused the change in evaporative heat loss between 17 and 30 minutes.
		(2 marks)
	(ii)	Evaporative heat loss decreases only gradually after the period of exercise. Explain why.
		(1 mark)

Turn over for the next question

4 The diagram shows the life cycle of a red admiral butterfly.

S	(a)	What type of cell division occurs during the larval stages? Explain your answer.	
			•••••
			(1 mark)

(b) In one study, the lengths of seven individuals of the first and fifth larval stages were measured. The results are shown in the table.

Lengths of individuals/mm		
1 <sup>st</sup> larval stage	5 <sup>th</sup> larval stage	
5.2	46.3	
7.6	47.5	
7.8	48.0	
9.0	49.5	
10.2	50.2	
10.3	50.9	
11.2	52.0	

Calculate the percentage increase in median length from the first to the fifth larval stage.

Show your working.

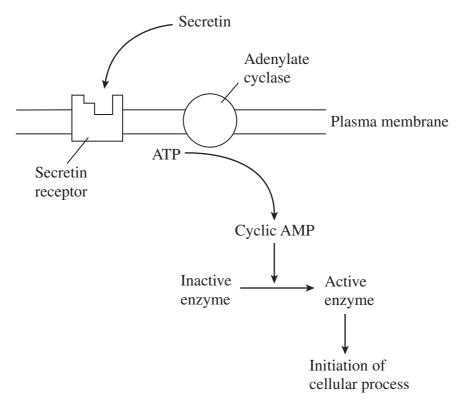

(c)	The larvae feed on the leaves of nettles. The adult butterflies feed on nectar. Nectar is
	rich in sugars but contains little protein.
	Explain the importance of the difference in diet of the larvae and the adults.

Percentage increase in median length = ..... (2 marks)

(2 marks)

(1 *mark*)

- Secretin is one of the hormones that controls the secretion of digestive juices.(a) Give one effect of the increased secretion of secretin.
- **S** (b) The diagram shows the way in which secretin operates.

i)	Secretin targets only certain cells in the body. Explain why.	
		(2 marks)
		(2 marks)

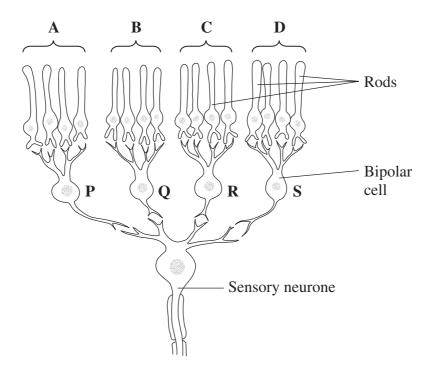

In the absence of cyclic AMP, the enzyme is inactivated by a non-competitive inhibitor. Explain how a non-competitive inhibitor makes an enzyme inactive.

(2 marks)

•••••	(1 mark)
•	gfish live in freshwater lakes in South Africa. They excrete nitrogenous waste agh their kidneys and their gills.
(i)	The nitrogenous waste of lungfish is converted in the liver to glutamine and transported in the blood plasma in this form. Glutamine is non-toxic, but cannot be excreted. An enzyme catalyses the conversion of glutamine to glutamate and ammonia. Explain the advantage of cells in the gills containing this enzyme.
	(3 marks)
(ii)	During droughts, the lakes in which lungfish live dry up. Lungfish survive enclosed in a layer of mucus and dry mud. During this time, they excrete urea instead of ammonia. Explain the importance of the change in their excretory product.
	(2 marks)

(a)	Describe how an action potential is produced in a neurone.
	(4 marks)
(b)	Describe how an impulse is transmitted across an excitatory synapse.
	(3 marks)

The diagram shows connections between cells in the retina.

(c)	Expl	ain how the conn	ection of several	rods to a single	bipolar cell influ	iences
	(i)	visual acuity,				
	(ii)	sensitivity.				
						(4 marks)
(d)	Diffe	erent groups of ro	ds were illumina	ted. The impuls	es produced in tl	, ,
(3)		n the sensory neu				
			<b>Experiment 1</b>	<b>Experiment 2</b>	<b>Experiment 3</b>	<b>Experiment 4</b>

**8** (a) Two plants of a similar height were growing in the same conditions. The table shows their rate of water uptake and water loss over a 25-hour period in summer.

Time of day	Plant A		Plant B	
Time of day	Water uptake/g	Water loss/g	Water uptake/g	Water loss/g
0300-0400	0.0	1.0	3.0	4.0
0700 - 0800	1.0	3.0	4.0	11.0
1100-1200	5.0	23.5	25.0	49.0
1500-1600	10.0	24.0	32.0	41.0
1900-2000	11.5	7.0	18.0	10.0
2300-2400	1.0	0.0	5.0	5.0
0300-0400	0.0	1.5	2.5	4.0

(1)	The patterns of water uptake and patterns of water loss are similar in both plants.  Describe these similarities.
	(1 mark)
(ii)	In plant <b>A</b> , water loss starts before water uptake. Explain why.
	(5 marks)

S	(iii)	Use your knowledge of Fick's law to suggest an explanation for the greater rates of water loss by plant <b>B</b> .
		(2 marks)
(b)	-	ain <b>three</b> ways in which xerophytic plants minimise water loss due to piration.
	1

Question 8 continues on the next page

(c) The kangaroo rat is a small mammal that lives in the desert and is adapted to conserve water. It is able to obtain all the water it needs from the respiration of glucose and fatty acids. The equations summarise the aerobic respiration of glucose and of palmitic acid (a typical fatty acid). The figures in brackets show the mass of some of the substances used and produced as well as the energy transferred to ATP when one mole of each substance is respired.

Glucose 
$$C_6H_{12}O_6 + 6O_2 \rightarrow 6CO_2 + 6H_2O + 38ATP$$
  
(180 g) (1178 kJ)

Palmitic acid 
$$C_{15}H_{31}COOH + 23O_2 \rightarrow 16CO_2 + 16H_2O + 130ATP$$
 (256 g) (288 g) (3913 kJ)

Use the data to suggest why a diet with more fatty acid than glucose is beneficial to a kangaroo rat.

Use suitable calculations to support your answer. Show your working.
