

GCE AS MARKING SCHEME

SUMMER 2016

**COMPUTER SCIENCE - NEW AS UNIT 2
2500U20-1**

INTRODUCTION

This marking scheme was used by WJEC for the 2016 examination. It was finalised after detailed discussion at examiners' conferences by all the examiners involved in the assessment. The conference was held shortly after the paper was taken so that reference could be made to the full range of candidates' responses, with photocopied scripts forming the basis of discussion. The aim of the conference was to ensure that the marking scheme was interpreted and applied in the same way by all examiners.

It is hoped that this information will be of assistance to centres but it is recognised at the same time that, without the benefit of participation in the examiners' conference, teachers may have different views on certain matters of detail or interpretation.

WJEC regrets that it cannot enter into any discussion or correspondence about this marking scheme.

GCE COMPUTER SCIENCE
SUMMER 2016 MARK SCHEME
UNIT 2

Guidance for examiners

Positive marking

It should be remembered that learners are writing under examination conditions and credit should be given for what the learner writes, rather than adopting the approach of penalising him/her for any omissions. It should be possible for a very good response to achieve full marks and a very poor one to achieve zero marks. Marks should not be deducted for a less than perfect answer if it satisfies the criteria of the mark scheme.

For questions that are objective or points-based the mark scheme should be applied precisely. Marks should be awarded as indicated and no further subdivision made.

For band marked questions mark schemes are in two parts.

Part 1 is advice on the indicative content that suggests the range of computer science concepts, theory, issues and arguments which may be included in the learner's answers. These can be used to assess the quality of the learner's response.

Part 2 is an assessment grid advising bands and associated marks that should be given to responses which demonstrate the qualities needed in AO1, AO2 and AO3. Where a response is not credit worthy or not attempted it is indicated on the grid as mark band zero.

Banded mark schemes

Banded mark schemes are divided so that each band has a relevant descriptor. The descriptor for the band provides a description of the performance level for that band. Each band contains marks.

Examiners should first read and annotate a learner's answer to pick out the evidence that is being assessed in that question. Once the annotation is complete, the mark scheme can be applied.

This is done as a two stage process.

Stage 1 – Deciding on the band

When deciding on a band, the answer should be viewed holistically. Beginning at the lowest band, examiners should look at the learner's answer and check whether it matches the descriptor for that band. Examiners should look at the descriptor for that band and see if it matches the qualities shown in the learner's answer. If the descriptor at the lowest band is satisfied, examiners should move up to the next band and repeat this process for each band until the descriptor matches the answer.

If an answer covers different aspects of different bands within the mark scheme, a 'best fit' approach should be adopted to decide on the band and then the learner's response should be used to decide on the mark within the band. For instance if a response is mainly in band 2 but with a limited amount of band 3 content, the answer would be placed in band 2, but the mark awarded would be close to the top of band 2 as a result of the band 3 content.

Examiners should not seek to mark candidates down as a result of small omissions in minor areas of an answer.

Stage 2 – Deciding on the mark

Once the band has been decided, examiners can then assign a mark. During standardising (marking conference), detailed advice from the Principal Examiner on the qualities of each mark band will be given. Examiners will then receive examples of answers in each mark band that have been awarded a mark by the Principal Examiner. Examiners should mark the examples and compare their marks with those of the Principal Examiner.

When marking, examiners can use these examples to decide whether a learner's response is of a superior, inferior or comparable standard to the example. Examiners are reminded of the need to revisit the answer as they apply the mark scheme in order to confirm that the band and the mark allocated is appropriate to the response provided.

Indicative content is also provided for banded mark schemes. Indicative content is not exhaustive, and any other valid points must be credited. In order to reach the highest bands of the mark scheme a learner need not cover all of the points mentioned in the indicative content but must meet the requirements of the highest mark band. Where a response is not creditworthy, that is contains nothing of any significance to the mark scheme, or where no response has been provided, no marks should be awarded.

	5 - 6 marks
3	<p>The candidate has:</p> <ul style="list-style-type: none"> • written an extended response that has a sustained line of reasoning which is coherent, relevant, and logically structured • shown clear understanding of the requirements of the question and a clear knowledge of the indicative content. Clear knowledge is defined as a response that provides five to six relevant detailed points on the selection and justification of the proposed method of solution for the three main requirements listed in the scenario • addressed the question appropriately with minimal repetition and no irrelevant material • presented a balanced discussion and justified their answer with examples • used appropriate technical terminology referring to the indicative content confidently and accurately.
	3 - 4 marks
2	<p>The candidate has:</p> <ul style="list-style-type: none"> • written a response that has an adequate line of reasoning with elements of coherence, relevance, and logical structure • shown adequate understanding of the requirements of the question and a satisfactory knowledge of the topic of changeover as specified in the indicative content. Satisfactory knowledge is defined as a response that provides three to four points on the selection and justification of the proposed method of solution for the three main requirements listed in the scenario • presented a discussion with limited examples • used appropriate technical terminology referring to the indicative content.
	1 – 2 marks
1	<p>The candidate has:</p> <ul style="list-style-type: none"> • written a response that that lacks sufficient reasoning and structure • produced a discussion which is not well developed • attempted to address the question but has demonstrated superficial knowledge of the topics specified in the indicative content. Superficial knowledge is defined as a response that provides one to two points on the selection and justification of the proposed method of solution for the three main requirements listed in the scenario • used limited technical terminology referring to the indicative content.
0	0 marks Response not credit worthy or not attempted.

Q	Answer	Mark	AO1	AO2	AO3	Tot
5	<p>Indicative content:</p> <p>Answer must be within the context of the holiday booking scenario:</p> <ul style="list-style-type: none"> • Suitable mode of operation: Real Time Transaction • Unsuitable modes of operation: Batch Processing • Accepted but not expected unsuitable mode of operation: Real Time. <p><u>Batch processing</u></p> <ul style="list-style-type: none"> • One or more programs (together with any data needed) are submitted to the computer as a 'job' and put in a queue to await processing, possibly “many holiday bookings, placed in queue”. • There is no interaction between user and computer. – This would be unsuitable for Happy Hols customers. • Processing can be done at off-peak times such as overnight, as no interaction is needed. – Unsuitable as customers may want to adjust options chosen, level of service etc. • Batch processing is normally associated with mainframes, but Happy Hols are more likely to have windows based pcs. • Batch processing systems are not always up-to-date. This would be unsuitable for Happy Hols as customer requests could lead to a double booking. <p><u>Real time</u></p> <ul style="list-style-type: none"> • Real-time is a mode of operation where data received by the computer is immediately processed, stored data is updated and any necessary actions taken. This is more suitable for safety critical operation. Happy Hols customers may wish to multi-task and look at different options available on the internet and research into many different websites. • The computer used in a real-time system is dedicated - it does nothing else – unsuitable for Happy Hols as both staff and customers may wish to use the computer. • A system like this will be safety-critical – human life is at risk if the software fails (has to fail safe) – Unnecessary for Holiday booking software. • It is also likely to be highly complex/specialised software (and hardware) – unsuitable for a small travel company such as Happy Hols. 	8		2.1b		8

	<p><u>Real time transaction systems (Correct system)</u></p> <ul style="list-style-type: none"> • An on-line system in which individual, discrete transactions are processed as they occur. • When a transaction is received by the computer, the data stored is very quickly updated. This should ensure in a booking system that no two customers make the same booking. 'Real-time' basically means that if you look at the state of the system at any instant it is always up-to-date, i.e. that holiday slot or hotel room is now taken and not available for other customers of Happy Hols to book. • The transaction is locked (record locking) until the booking is confirmed (allowing the customer to change their mind). / unconfirmed bookings are released back into the 'available' list.
