## **Proposal to upgrade the computer provision**

It is proposed to upgrade the computer provision in the design department of Hothouse Design. Whilst on the current business plan refurbishment, redesign and re-equipping this area of the building was scheduled for the next financial year, the demand for, and rapid growth of this department has meant that this must be considered immediately.

**Body style**  
 see below

## **Existing System - Personnel**

**Heading style**  
 See above

The department has until last week comprised a senior graphics designer and a team of 5 graphic designers with varying backgrounds and designations. The current software is Adobe Pagemaker v4.00 with which all the existing staff are fully familiar. During the past week two new graphic designers have been appointed to

the team. The available floor space and business projections suggest that one senior designer and 11 designers may be employed by the end of the year. As the team is expanding rapidly it is likely that one appointment may be at a more senior level but this decision has yet to be ratified by the board.

**2 columns**  
 Applied to this paragraph only

## **Physical location**

**Heading style**  
 See above

**Body style**  
 see below

Workstations are currently located: one in the senior graphic designer's office and five in an open plan office space due for refurbishment. A map showing a summary layout of this floor is shown to the right. There will be an immediate need to redevelop this entire floor of the building to accommodate our new employees and cater for projected growth. Some of the rooms in this area are either underused or unused and would offer an excellent opportunity to expand. If it was deemed appropriate the staff rest room could be accommodated on another floor of the building. The full list of rooms available for consideration in this area of the building which are in close proximity to this open plan area is below.

### Shared information

Body style  
see above

Each designer has their own work area, they can also save designs to a central design bank (currently held on drive V:) send copies of their designs to a shared printer and a shared plotter. This currently slows down two of the machines as they are hosting the network software for serving both the printer and plotter. Scanning is done on a single machine which is currently causing major access problems. The system has access to the internet (although the security is somewhat dubious) and the designers attach designs and design elements to e-mails when sharing ideas or information. Applications software is held on each workstation. The single fileserver hosts the internet access, e-mail and file management systems and is currently overstretched. Backups are made weekly.

### Software – Design Packages

Data Entry  
Must be 100%  
Accurate  
Heading style  
See above

Body style  
see above

Following packages have been short listed: Quark Xpress, Pagemaker and Publisher. Quark Xpress 4.1 is almost recognized as the industry standard for professional design. Although expensive it contains many enhanced features and will allow the use of exceptional resolutions which would prove useful providing the input and output peripherals selected can handle these types of resolution. Adobe Pagemaker v7.00 has for the Hothouse team a great advantage in that the staff are already familiar with earlier version, therefore the transition to this would be more time effective as well as cost effective and probably less stressful on the existing design team. Microsoft Publisher is the third option, not because of the product quality but this platform is used by many small freelance designers and having the same platform as them would make the use of consultants at busy periods a viable option. Final decisions on this element will need to be taken in the near future.

### **Hardware – Workstation Specifications**

Heading style  
See above

Taking into account the three short listed packages it has been decided that the computer specifications to enable any of these packages to run, must as a minimum have a processor speed of at least 950 megahertz and at least 256 megabytes of random access memory. So far only a handful of the perspective hardware suppliers have given us a quotation but the computer specifications listed below are those which match the specifications so far.

**Proposal to upgrade the administration computer**

Data Entry  
Must be 100% Accurate  
Heading style  
See above

It is proposed to upgrade the single administration computer within the interior design department of Hothouse Design. This computer will be a single machine replacement with the current machine being donated to a local primary school (which has yet to be chosen). The computer will continue to have the same primary function of holding all the

appointments for the producing the word processed desktop published quotations for customers and for general secretarial purposes. This computer will not be used for the design process or storage of any of the design elements.

Body style  
see below

**Specification**

Heading style  
See above

2 columns  
Applied to this paragraph only

1. At least 700mhz Pentium 4 processor
2. CD-ROM, CD-Rewriter or DVD drive
3. At least 25gb hard drive
4. Windows 2000, XP or greater
5. Microsoft Office XP Professional

Numbered list 1-5  
Do not penalise if indented due to software autonumbering

The supplier for the hardware has already been selected by the Information and Communications Technology Department, under their current development and purchasing plan. The current prices of all the available machines from this manufacturer are now in the office and data has been extracted from this document for the purposes of generating this report. The prices and specifications quoted are only valid for a period of 14 days. If updated figures become available they will be appended to this document. The exact workstation specification and major application packages which are recommended are listed above.

**Network Resources**

Heading style  
See above

Body style  
see below

There are no plans to upgrade the available in this office, the Hewlett Packard laser printer has proved a reliable and robust peripheral, and the servers (both PDC and BDC) are more than adequate for the projected use in the next six month period. To facilitate future network developments however it is proposed to use a 10/100 switchable network interface card in this machine. The current CAT5 network cabling can handle the increase in network speed to 100 megabits per second and the proposed introduction of new switchable hubs to allow both speeds of traffic on the network at the same time will greatly improve performance.

## Refurbishment

Body style  
see above

When the current machine is replaced it is proposed to redesign the work area with the aim to improve the quality of life of the office workers. The introduction of our own brand office fixtures and fittings will provide ergonomic, multifunctional workstation solutions that make best use of the available floor space. It is proposed to redesign this area of the Interior Design office in laminated beech. Although it is not intended as a 'show' area, there may be some marketing potential in photographing the refurbished work area when it is completed and the new computer installed. In view of this we have had one section of the current area photographed, to enable us to do a 'before' and 'after' comparison. The suppliers of the hardware would also like copies of the

'after' photographs to use in their promotional materials. A copy of the proposed 'before' picture can be seen on the left.

The staff who work in the interior design department have requested that the colour scheme for the room is changed to three colours of green, a pale (slightly olive) green as the base colour, with two graded darker shades of green and a gold to highlight individual features and provide a suitable contrast.

## Monitor

Heading style  
See above

Body style  
see above

The current 14 inch monitor should also be replaced. Discussion is to the merits of CRT against LCD, although LCD would be the preferred option based upon ergonomics and the marketing value from the proposed photographs; as Hothouse Design want to be recognised as a very forward looking and high tech business partner.

## CD-ROM Drive

Heading style

Column 3 (Manufacturer) deleted

<b>Page 4</b>	<b>Mark Scheme</b>	<b>Module</b>
	<b>ICT CAREER AWARD - 2003</b>	<b>5201/B</b>

A CD-ROM Drive of some description is needed. Options to consider include a CD-ROM, CD-Rewriter, or DVD drive. The merits of each of these types of device need to be fully investigated. The following chart gives a brief insight into the comparative costs of computers fitted with each type. The figures are averages taken from the current supplier's price list.

## Cost Effective Solutions

One measure which can often be effective in addressing options is to find the cost per megabyte of RAM. This is only a rough solution and many other factors must be taken into account. Given the large number of computers to select from, we have decided to initially consider computers which cost less than £10 per megabyte of RAM. One other specification which the Information and Communication Technology department were insistent upon was the selection of computers with Pentium 4 processors. This table shows computers which meet both of these specifications. The data omitted from this table contains the CD drive details.

## **New Manufacturing Plant**

Hothouse Design has been commissioned to design the new manufacturing plant for Tola Irrigation. This plant must be located within the United States of America due to the accessibility of the North American markets but there is no specific requirement to build

the plant on mainland North America. This means that the satellite states of Hawaii and Alaska could be considered along with other areas like the Virgin Islands which would still be considered as within the United States trading block.

## **Design Stages**

Heading style  
 See above

2 columns  
 Applied to first paragraph only

The design element of this plant will be in several stages with agreed stage payments. Each must be approved by both Hothouse Design and Tola Irrigation including the time lines, personnel and eventually drawing up of the contracts. The proposed stages are the initial stage, which will culminate in the selection of a preferred location. The secondary stage will be to design the outline layout of the plant including the cost projections for these designs. Further stages will be to complete the design elements (in detail) within the budget set and to oversee the development in a consultancy role. For the final stage Tola Irrigation will commission Hothouse Design to create and manage the launch of the plant, focussing on 'The caring nature of both companies in helping to alleviate world poverty and starvation'.

## Initial Stage

1. Select states which have suitable criteria
2. Identify physical locations and constraints within those states
3. Consider the potential for localised economic growth
4. Consider transport links
5. Consider the willingness of the local communities to the project.

## Water

Heading style  
See above

Water is a vital resource, and must be available in a readily accessible form (probably as ground water reserves) in order for the plant to function. As vast quantities will be needed both for the manufacturing and testing of the products, the cost of sourcing this water must be minimal. As a forerunner to the selection process four potential states have been identified by Tola, each with its own strengths and weaknesses. Tola would be happy to endorse any of those listed, but less happy with some other states. Hothouse should therefore focus the research on these states:

Code	State	Location
V	Virgin Islands	
H	Hawaii	Mid
N	Nevada	Inland west
W	Washington DC	Mid East Coast

Table inserted  
Headings bold  
Body style  
Row 6 (Florida) deleted

## Manpower

Heading style  
See above

Body style  
see above

The second major resource that must be available is manpower. Looking at demographic changes for each of the counties within these areas should indicate which areas have population growth and which are in decline. The potential for moving into an area with a declining population would give a boost to the local economy, revitalise the area and provide new opportunities for its inhabitants. In these circumstances there will be less potential for problems with the planning applications and in ensuring that local officials will be more supportive of the development. The selected state must have sufficient population to ensure that some (or preferably most) of the labour force will be local. Tola however, does not wish the plant to be built close to large population centres, due to the requirement for using some hazardous chemicals as part of the process.

## Population of each State

Heading style  
See above

## County by County

Data Entry  
Must be 100% Accurate  
Heading style  
See above

Each County should be examined to see if it has suitable initially Counties with populations of less than 100,000 inhabitants and of less than 100 gallons per person per day. This figure indicates that there are no other major water using industries

Body style  
see above

within the immediate locality. Here is a table showing the Counties within all four States which meet both these criteria:

## **Products to be manufactured**

Heading style  
See above

Most of the products in Tola's current lines will be manufactured within the plant. The plant will be split into several sub-divisions. This will include the division dealing with the chemigation and fertigation products. The mainstay of Tola's business in this area is the development of liquid feed programmes suitable for the micro-irrigation systems. This will need to be housed a distance of at least 400 metres from the other areas of the plant. In addition to this it is proposed to add a research and development laboratory to this part of the complex, to enable the chemical engineers to develop and manufacture new product lines in this area. The engineering section will produce the products like the pumps, filters, valves, pressure compensating flow controllers, minisprinklers, self-propelled sprinklers, soil analysis equipment like EC and ph meters and their latest success story the recently patented super-strength seals. There are no plans to add research and development facilities for the engineering section within this plant as it is unlikely that one of the above locations would have potential employees with the necessary skills to undertake these roles and the currently established plant in Liberia has some room for expansion in this respect. The pipework division will manufacture the subsurface and UPVC conduit systems, the alcatene pipe, and the drip irrigation systems including the micro-porous pipes. This area will be developed to cater for the current manufacturing capacity plus twenty percent, but sufficient land must be available adjacent to this to enable future expansion.

## **New Manufacturing Plant**

Hothouse Design has been commissioned to design the new manufacturing plant for Tola Irrigation. This plant must be located within the United States of America for due to the accessibility of the North American markets but there is no specific requirement to build

the plant on mainland North America. This means that the satellite states of Hawaii and Alaska could be considered along with other areas like the Virgin Islands which would still be considered as within the United States trading block.

## **Design Stages**

The design element of this plant will be made in several stages with agreed stage payments. Each must be approved by both Hothouse Design and Tola Irrigation including the time lines, personnel and eventually drawing up of the contracts. The proposed stages are the initial stage, which will culminate in the selection of a preferred location. The secondary stage will be to design the outline layout of the plant including the cost projections for these designs. Further stages will be to complete the design elements (in detail) within the budget set and to oversee the development in a consultancy role. For the final stage Tola Irrigation will commission Hothouse Design to create and manage the launch of the plant, focussing on ‘The caring nature of both companies in helping to alleviate world poverty and starvation’.

There are many different ways of achieving the correct answers in this section.  
The coding shown is not the only method that can be used.

Printout for step 15

Code attached to the two buttons on the menu:

```
Private Sub cmdInvoice_Click()  
    stDocName = "invoice"  
    DoCmd.OpenReport stDocName, acPreview
```

End Sub

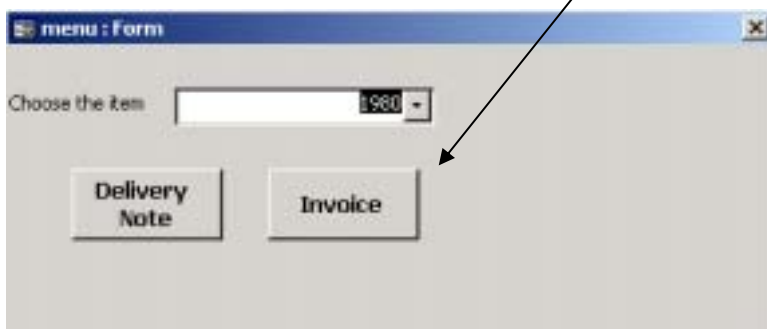

```
Private Sub cmdDeliveryNote_Click()  
    Dim stDocName As String  
    stDocName = "deliverynote"  
    DoCmd.OpenReport stDocName, acPreview
```

End Sub

Each report takes its data using the following SQL:

```
SELECT * FROM sculpt WHERE id=forms!menu!item;
```

- the combo box on the menu is called "item"
