

mark scheme

Practice Paper A : Core Mathematics 2

Question Number	General Scheme		Marks
1 (a) (b)	$\frac{4}{5}$	M1 – use of a triangle or $\sin^2 \theta = 1 - \cos^2 \theta$ A1 – cao	M1 A1 (2)
	$\frac{3}{5}$	M1 – use of a triangle or $\tan \theta = \frac{\sin \theta}{\cos \theta}$ with <i>their</i> $\sin \theta$ A1 – cao	M1 A1 (2)
Note	Award M1 in both parts if candidates draw a right angled triangle with the hypotenuse of length 5, the opposite of length 4 and the adjacent of length 3 in part (a), but do not award this if they draw the triangle in part (b)		
	Total		4

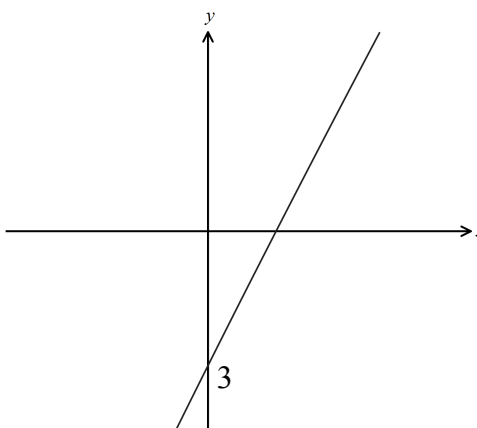

<p>2</p> <p>(a)</p>	$(2a+b)^8 = \underbrace{(2a)^8}_{\text{B1}} + \underbrace{{}^8C_1(2a)^7(b)^1 + {}^8C_2(2a)^6(b)^2 + {}^8C_3(2a)^5(b)^3 + \dots}_{\text{M1 A2}}$ <p>B1 – first term correctly expressed (need not be evaluated). Accept equivalent forms, i.e. ${}^8C_0(2a)^8(b)^0$</p> <p>M1 – second, third and fourth terms of the expansion of the form ${}^8C_{k/8-k}(2a)^{8-k}(b)^k$ isw</p> <p>A2 – correct unsimplified expansion in terms of binomial coefficients</p> $(2a+b)^8 = 256a^8 + 1024a^7b + 1792a^6b^2 + 1792a^5b^3 + \dots$ <p>A1 – correct simplified expansion</p> <p>Note: accept $\binom{n}{r}$ as alternative notation for nC_r throughout</p>	<p>B1</p> <p>M1</p> <p>A2</p> <p>A1</p> <p>(5)</p>
<p>(b)</p>	$\left(a + \frac{b}{2}\right)^8 = \left[\frac{1}{2}(2a+b)\right]^8 = \frac{1}{256}(2a+b)^8$	<p>B1 – cso</p> <p>The value of k must be clearly obtained and not just stated</p> <p>(1)</p>
<p>(c)</p>	$\frac{\frac{1}{256}(256a^8 + 1024a^7b + 1792a^6b^2 + 1792a^5b^3 + \dots)}{4ab}$ $\frac{1}{1024ab}(256a^8 + 1024a^7b + 1792a^6b^2 + 1792a^5b^3 + \dots)$ $= \frac{256a^8}{1024ab} + \frac{1024a^7b}{1024ab} + \frac{1792a^6b^2}{1024ab} + \frac{1792a^5b^3}{1024ab} + \dots$ $\frac{1}{4}a^7b^{-1} + a^6 + \frac{7}{4}a^5b + \frac{7}{4}a^4b^2 + \dots$	<p>M1 – correct method using (b)</p> <p>A1ft – correct expansion unsimplified</p> <p>A1 – cao</p> <p>(3)</p>
Total		9

3	(a)	<table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td>x</td> <td>2</td> <td>3</td> <td>4</td> <td>5</td> </tr> <tr> <td>y</td> <td>2.4142...</td> <td>1.3660...</td> <td>1</td> <td>0.8090...</td> </tr> </table>	x	2	3	4	5	y	2.4142...	1.3660...	1	0.8090...	B2 – correct values for x and y shown in a table or implied (B1 for one correct value)	B2
		x	2	3	4	5								
		y	2.4142...	1.3660...	1	0.8090...								
		$h = \frac{5-2}{3} = 1$	B1 – correct value for the height of each strip	B1										
		$\therefore \text{Area} \approx \frac{1}{2} [2.4142 + 0.8090 + 2(1.3660 + 1)]$	M1 – attempts to apply the trapezium rule using <i>their</i> values A1ft – correct expression ft of their values	M1 A1										
$\approx \frac{1}{2}(7.9552)$ ≈ 3.98	A1 – cao	A1 (6)												
(b)	It is an overestimate because the trapezia are above the curve	B1 – overestimate B1 – <i>idea that</i> the trapezia will be above the curve. Award this mark if candidates draw a diagram to illustrate this	B1 B1 (2)											
	Total		8											

4	(a)	$x^2 + (y-5)^2 = 5^2$	B1 – LHS correct oe B1 – RHS correct oe	B1 B1 (2)	
	(b)	$x^2 + (3x-5)^2 = 25$ $x^2 + 9x^2 - 30x + 25 = 25$	M1 – correct method to find the coordinates of intersection	M1	
		$x^2 - 3x = 0$ $x = 0, x = 3$	A1 – correct values of x	A1	
		$y = 3(3) = 9$ $\therefore P(3,9)$	M1 – substitutes $x = 3$ to find the y coordinate of P A1 – $P(3,9)$ cao	M1 A1 (4)	
	(c)	Method 1 $\cos \theta = \frac{5^2 + 5^2 - (3\sqrt{10})^2}{2(5)(5)}$ $= -\frac{4}{5}$	Alternative 1 $\theta = 180 - 2\left(90 - \tan^{-1} \frac{9}{3}\right)$ $\therefore \cos \theta = -\frac{4}{5}$	Accept other methods M1 – use of cosine rule or geometry A1 – cao	M1 A1 (2)
	(d)	Method 1 $\frac{1}{2} \times 5 \times 5 \times \sin \theta = 7.5$	Alternative 1 $\frac{9 \times 3}{2} - \frac{(9-5) \times 3}{2} = 7.5$	Accept other methods M1 – correct method A1 – 7.5	M1 A1 (2)
	(e)	$\text{Area of sector} = \frac{\theta}{2} r^2 = \frac{\cos^{-1}\left(-\frac{4}{5}\right)}{2} (5)^2 = 31.226\dots$	M1 – correct method to work out the area of the sector (accept working in degrees) A1 – correct area for the sector	M1 A1	
		$\text{Area of } R = 31.226\dots - 7.5 = 23.726\dots = 23.7$	M1 – area of sector – area of triangle A1 – cao, no ft	M1 A1 (4)	
		Total		14	

5	(a)	0.988	B1 – cao	B1 (1)
	(b)	$U_4 = 34000 \times 0.988^4 = \text{£}32000$ AWRT	M1 – expression in the form $34000 \times 0.988^{3/4}$, ft their (a). Power can be 3 or 4. A1 – cao (full answer = $\text{£}32397.14$)	M1 A1
	(c)	$34000 \times 0.988^N > 30000$ $0.988^N > \frac{15}{17}$	M1 – forms an equation of the form $r^N = \frac{30000}{34000}$ ft their (a). r^{N-1} shows M0 here	M1
		$N \log(0.988) > \log\left(\frac{15}{17}\right)$	M1 – uses logarithms to find N	M1
		$\therefore N < \frac{\log\left(\frac{15}{17}\right)}{\log(0.988)} < 10.367\dots$ $\therefore N = 10$	A1 – $N = 10$ Do not accept decimals.	A1
Note	Use of inequalities in not necessary in (c) – accept use of the equality sign. However, when the inequality sign is used, it must be reversed to score the final A mark.			
(d)	(i)	$U_N = a + (N-1)d$ $= 150 + (10-1)(100) = 1050$	M1 – use of $a + (N-1)d$, A1ft – correct answer ft their (c)	M1 A1 (2)
	(ii)	Takings in year 1 = $34000 \times 150 = \text{£}5100000$	B1 – cao	B1
		$34000 \times 0.988^{10} = \text{£}30133.42$	M1 – calculates the price of the car in year N	M1
		Takings in year $N = \text{£}31640000$	M1 – calculates the takings in year N	M1
		$\text{£}31640000 > \text{£}5100000$, hence there were more takings in the year N	A1 – correct answer and a justification	A1 (4)
(e)	(Very) effective because more individuals are buying the car each year / the takings increased / owtte	B1 – effective + an appropriate justification <u>in context</u>	B1 (1)	
Total				13

6 (a)	$\log_3(3b) + \log_9(b) = 2$	M1 – attempt to obtain an equation with one variable	M1
	Since $\log_3(x) = 2\log_9(x)$, $2\log_9(3b) + \log_9(b) = 2$	B1 – this principle seen anywhere (candidates may use the formula from the booklet to obtain this)	B1
	$\log_9(9b^3) = 2$ $9b^3 = 81 \rightarrow b = \sqrt[3]{9}$	M1 – use of multiplication rule for logs M1 – removal of the logs A1 – correct exact value for b	M1 M1 A1
	$\therefore a = 3\sqrt[3]{9}$	M1 – substitutes <i>their</i> b into an equation to find a A1 – correct exact value for a	M1 A1
	Total		7
ALT	<p>If candidates use the formula to change the base, sight of</p> $\log_3(3b) = \frac{\log_9(3b)}{\log_9 3} = 2\log_9(3b)$ <p>is <i>all</i> needed for B1.</p> <p>Candidates may then, alternatively, change the $\log_9 b$ term to $\frac{1}{2}\log_3 b$, which should also be accepted. Note also that candidates may make a substitution for b at the beginning of the question – although this is likely to prove tougher algebraically.</p>		

7 (a)	$\frac{dy}{dx} = 3x^2 - 6x + 27$	M1 – correct method to differentiate one term A1 – correct derivative	M1 A1 (2)	
(b)	If increasing, $\frac{dy}{dx} > 0$ $3x^2 - 6x + 27 = 3\left(x^2 - 2x + \frac{27}{3}\right)$ $= 3\left[(x-1)^2 - 1 + \frac{27}{3}\right] > 0$ for all x	B1 – idea that, if increasing, $\frac{dy}{dx} > 0$ M1 – completes the square to show that <i>their</i> $\frac{dy}{dx} > 0$ A1 – correct proof	B1 M1 A1 (3)	
(c)	If there are no stationary points, $3x^2 - 6x + 27 = 0$ has no solutions.	B1 – idea that, if there are no stationary points, there is no value of x such that $\frac{dy}{dx} = 0$	B1	
	Method 1: $(x-1)^2 = -8$ $x-1 \neq \sqrt{-8}$ Hence, the curve has no stationary points	Method 2: $6^2 - 4(3)(27) = -288 < 0$ Since $b^2 - 4ac < 0$, the curve has no stationary points	M1 – correct method to show the derivative has no solutions A1 – correctly shows and justifies that the derivative has no solutions	M1 A1 (3)
(d)		B1 – correct shape (see note) B1 – passes through $y = 3$	B1 B1 (2)	
Note	Ideally, the sketches should be <i>slightly</i> curvaceous. Although, due to scales, you should be prepared to accept completely straight lines here. Do not , however, accept sketches that imply the presence of stationary points or points of inflection.			
	Total		7	

8	(a)	$\sin \theta - \frac{1}{\sin \theta} \equiv \frac{\sin^2 \theta - 1}{\sin \theta}$	M1 – use of a common denominator	M1
		$\equiv \frac{-\cos^2 \theta}{\sin \theta} \equiv -\cos \theta \times \frac{\cos \theta}{\sin \theta}$	M1 – use of $1 - \sin^2 \theta = \cos^2 \theta$	M1
		$\equiv -\cos \theta \times \frac{1}{\tan \theta} = -\frac{\cos \theta}{\tan \theta}$	A1 – correct proof showing all intermediate steps	A1
				(3)
	(b)	$\tan^2 2x = \frac{2}{\cos 2x} \left(-\frac{\cos 2x}{\tan 2x} \right) + \tan^2 2x - 4$	B1 – correct LHS M1 – use of (a) to simplify the RHS	B1 M1
		$4 = -\frac{2}{\tan 2x}$ $\tan 2x = -\frac{1}{2}$	A1 – correct simplification	A1
		$2x = \tan^{-1} \left(-\frac{1}{2} \right) = -0.463\dots$	dmM1 – $2x = \tan^{-1}(n)$	M1
		$2x = \pi - 0.463\dots, 2\pi - 0.463\dots,$ and $2\pi + (\pi - 0.463\dots), 2\pi + (2\pi - 0.463\dots)$	ddM1 – attempt to find values of $2x$ between 0 and 4π	M1
	$2x = 2.678\dots, 5.820\dots, 8.961\dots, 12.103\dots$ $x = 1.3, 2.9, 4.5, 6.1 \text{ AWRT}$	ddM1 – divides at least one of their values of $2x$ by 2 A1 – correct values of x	M1 A1 (7)	
	Total		10	

Notes on alternative methods:

This mark scheme may feature some alternative solutions, but, of course, at this level, there is likely to be questions that have many others. Where alternative methods are used, you should award full marks **if the method is correct** (do **not** award full marks for methods that coincidentally lead to the right answer). If the method is *not* correct, then you should aim to mark it by being as faithful to the original scheme as you can and ensure that you award the same amount of marks for the same amount of *progress* in a question as you would award using the general scheme.
