ASSESSMENT and QUALIFICATIONS ALLIANCE

PHYSICS (SPECIFICATION A) **PHAP**
Practical (Units 5-9)

Friday 21 May 2004 Morning Session

In addition to this paper you will require:
- a calculator,
- a pencil and a ruler.

Time allowed: 1 hour 45 minutes

Instructions
- Use blue or black ink or ball-point pen.
- Fill in the boxes at the top of this page.
- Answer **both** questions in the spaces provided. All working must be shown.
- Do all rough work in this book. Cross through any work you do not want marked.

Information
- The maximum mark for this paper is 30.
- Mark allocations are shown in brackets.
- The paper carries 5% of the total marks for Physics Advanced.
- A *Data Sheet* is provided on pages 3 and 4. You may wish to detach this perforated sheet at the start of the examination.
- You are expected to use a calculator where appropriate.
- You are advised to spend no more than 30 minutes on Question 1.

Data Sheet

- A perforated Data Sheet is provided as pages 3 and 4 of this question paper.
- This sheet may be useful for answering some of the questions in the examination.
- You may wish to detach this sheet before you begin work.

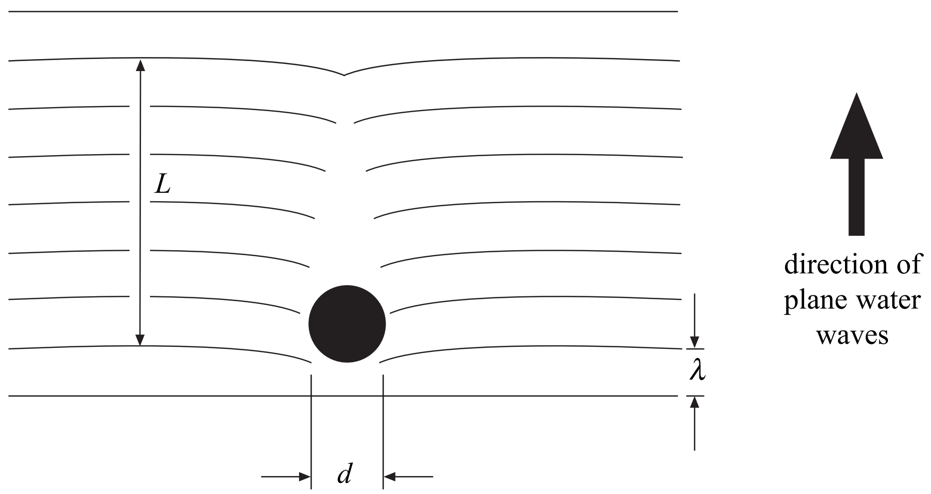
Answer **both** questions.

You are advised to spend no more than 30 minutes on Question 1.

1 Plane water waves are produced using a ripple tank. The waves flow around an upright cylindrical object of diameter, d, to produce the diffraction pattern shown in the plan view below.



Although a shadow is produced in the region behind the object, the diffraction produces a 'healing' of the waves and after a distance, L, the waves join up again. If the wavelength, λ, of the water waves is reduced, L is found to increase.

A student investigates the healing effect produced when a metal wire is illuminated by visible light. A screen placed several metres behind the wire enables the diffraction pattern produced by the wire to be observed. The centre of this diffraction pattern is bright. If the screen is placed a few centimetres behind the wire the centre of the diffraction pattern is now dark. The student correctly assumes that the screen now lies in the shadow of the wire so the point where the light waves heal up lies somewhere between the two screen positions.

It is suggested that the healing distance, L, is related to the diameter of the wire, D, by a power law of the form $L \propto D^n$, where n is an integer.
Design an experiment to discover the value of the integer, n.

You should assume that the normal laboratory apparatus used in schools and colleges is available to you. You may wish to draw a diagram to illustrate your answer.

You should also include the following in your answer:

- The quantities you intend to measure and how you will measure them.
- How you propose to use your measurements to obtain reliable results for the value of n.
- The factors you will need to control and how you will do this.
- How you could overcome any difficulties in obtaining reliable results.

Write your answers to Question 1 on **pages 6 and 7** of this booklet. *(8 marks)*

2 You are required to investigate how a voltmeter reading varies with time as a charged capacitor in a concealed circuit is discharged.

No description of the experiment is required.

(a) Connect the positive lead of the voltmeter to terminal Y and the negative lead to terminal Z. Switch S should be **closed.**
Charge the capacitor by connecting the flying lead to terminal C.
The required arrangement is shown in **Figure 1**.

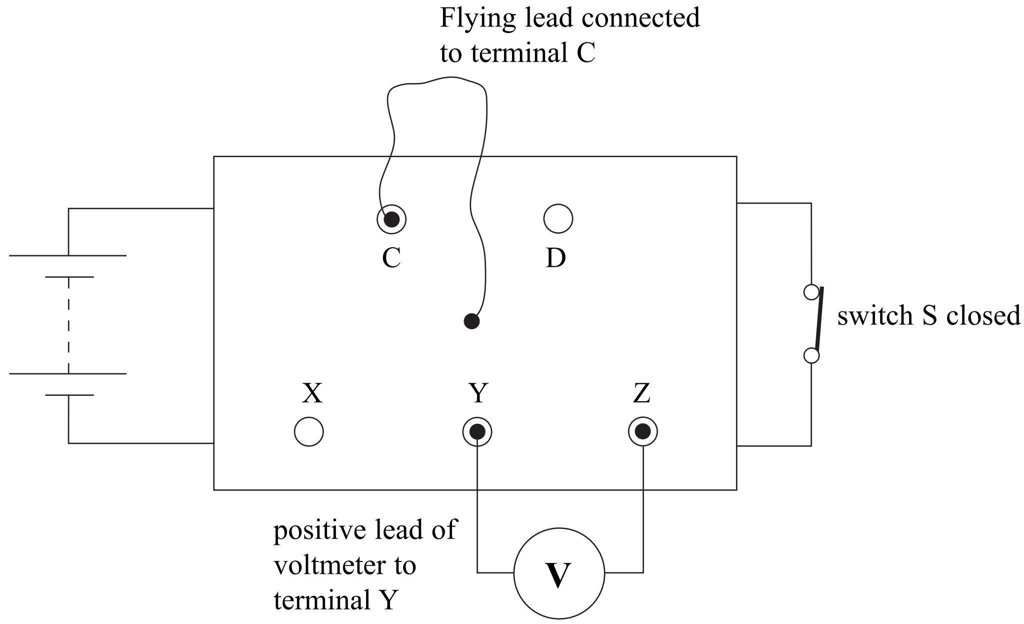

Figure 1

Read and record the voltmeter reading V_0.

V_0 = ...

(b) Connect the flying lead to terminal D and **at the same time** start the stopwatch.
Read the voltmeter readings, V_1, at regular intervals until the reading has fallen to approximately 10% of V_0.
In order to gather additional data, the procedure may be repeated by first charging the capacitor as in part (a) of the question.
Record your measurements for V_1 in the space provided on **page 10**.

(c) Connect the positive lead of the voltmeter to terminal X and the negative lead to terminal Y. Switch S should be **open**.
Charge the capacitor by connecting the flying lead to terminal C.
The required arrangement is shown in **Figure 2**.

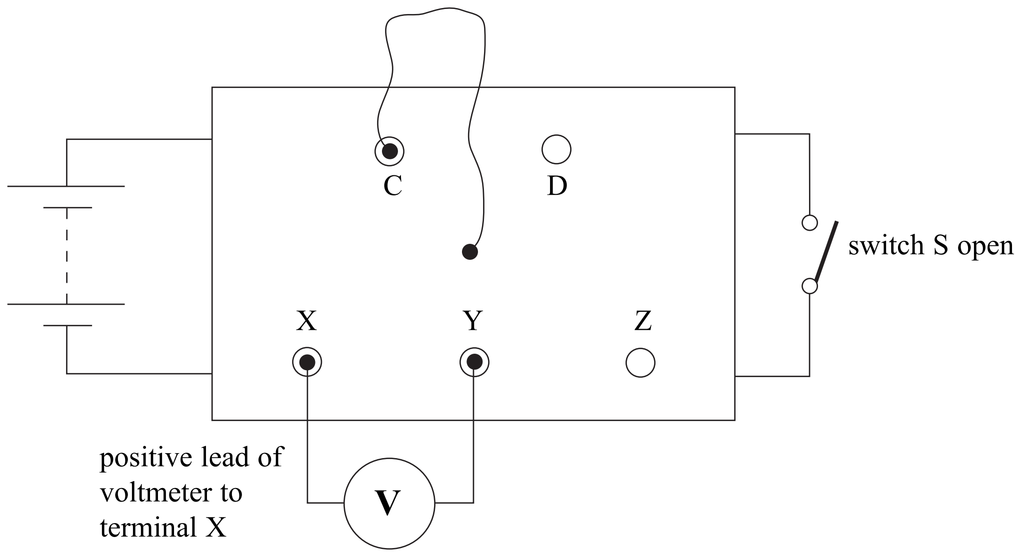

Figure 2

Connect the flying lead to terminal D and read the voltmeter readings, V_2, at regular intervals for a similar period to that in part (b).
Record your measurements for V_2 alongside V_1 on **page 10**.

(f) (i) For the circuit in part (b) of the question, the time constant, τ_b is the time for the voltmeter reading to fall to 37% of V_0. For the circuit in part (c) of the question, the time constant τ_c is the time for the voltmeter reading to rise to 63% of V_0.
