PHYSICS (SPECIFICATION A) **PHA7/W**
Unit 7 Nuclear Instability: Applied Physics Option

Thursday 14 June 2007 9.00 am to 10.15 am

For this paper you must have:
- a calculator
- a pencil and a ruler.

Time allowed: 1 hour 15 minutes

Instructions
- Use blue or black ink or ball-point pen.
- Fill in the boxes at the top of this page.
- Answer **all** questions.
- Answer the questions in the spaces provided.
- Show all your working.
- Do all rough work in this book. Cross through any work you do not want to be marked.

Information
- The maximum mark for this paper is 40.
- Two of these marks will be awarded for using good English, organising information clearly and using specialist vocabulary where appropriate.
- The marks for questions are shown in brackets.
- A *Data Sheet* is provided on pages 3 and 4. You may wish to detach this perforated sheet at the start of the examination.
- You are expected to use a calculator where appropriate.
- Questions 1(a) and 5(b) should be answered in continuous prose. In these questions you will be marked on your ability to use good English, to organise information clearly and to use specialist vocabulary where appropriate.

SECTION A: NUCLEAR INSTABILITY

Answer **all** of this question.

1 (a) X and Y are two different β emitting sources. Initially they contain the same number of unstable nuclei. Both sources have their emissions recorded over a period of time. The *decay constant* of source X is greater than that of Y. State what is meant by decay constant and describe **two** differences in the recordings from the two sources.

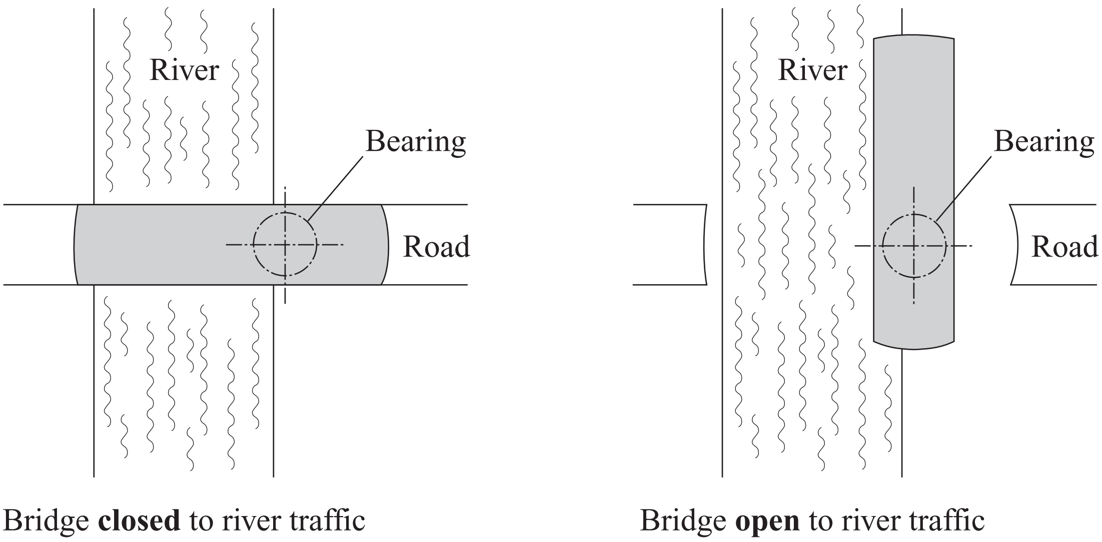
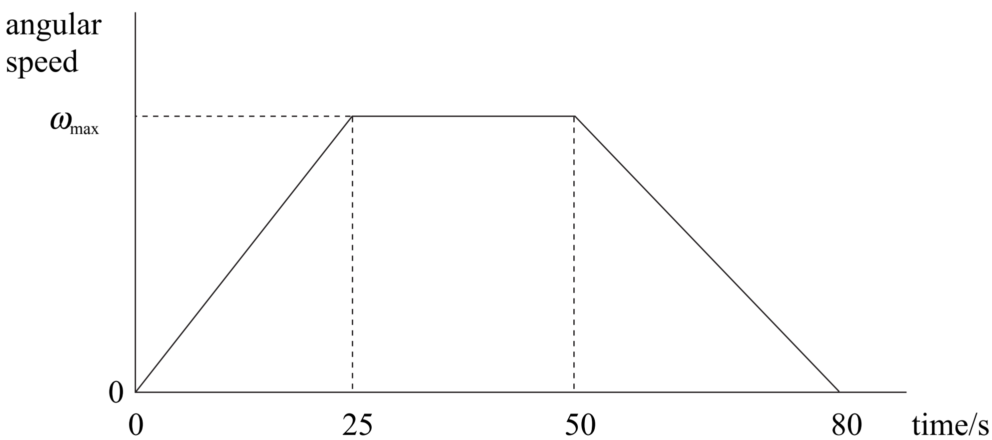
3 A swing bridge carries road traffic over a river. To allow movement of river boats, the bridge opens by turning through an angle of 90° in a time of 80 seconds. **Figure 1** shows plan views of the bridge in closed and open positions.

Figure 1



The graph below shows the variation of angular speed of the bridge from fully closed to fully open. The bridge accelerates, moves at constant angular speed and then decelerates to a standstill.



LEAVE MARGIN BLANK

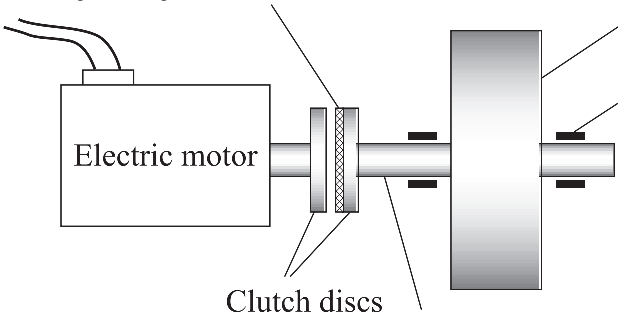
4 **Figure 2** shows a friction clutch which enables an electric motor to be easily connected to and disconnected from a flywheel. When the motor needs to be connected to the flywheel the discs are forced into contact and slipping occurs for a short time until the motor and flywheel rotate at a common angular speed. The clutch is then said to be engaged.

Figure 2



(a) The flywheel is initially stationary and the motor is rotating at 1500 rev min^{-1}. The rotating parts (the rotor and clutch disc) of the electric motor have a moment of inertia of 0.56 kg m^2.
Calculate the angular momentum of the motor.
