

# **Thursday 17 May 2012 – Morning**

## **AS GCE PHYSICS B (ADVANCING PHYSICS)**

**G491 Physics in Action**

Candidates answer on the Question Paper.

**OCR supplied materials:**

- Data, Formulae and Relationships Booklet (sent with general stationery)

**Other materials required:**

- Electronic calculator
- Ruler (cm/mm)

**Duration: 1 hour**

Candidate forename					Candidate surname				
--------------------	--	--	--	--	-------------------	--	--	--	--

Centre number						Candidate number			
---------------	--	--	--	--	--	------------------	--	--	--

### **MODIFIED LANGUAGE**

#### **INSTRUCTIONS TO CANDIDATES**

- Write your name, centre number and candidate number in the boxes above. Please write clearly and in capital letters.
- Use black ink. HB pencil may be used for graphs and diagrams only.
- Read each question carefully. Make sure you know what you have to do before starting your answer.
- Show clearly the working in all calculations, and give answers to only a justifiable number of significant figures.
- Write your answer to each question in the space provided. Additional paper may be used if necessary but you must clearly show your candidate number, centre number and question number(s).
- Answer **all** the questions.
- Do **not** write in the bar codes.

#### **INFORMATION FOR CANDIDATES**

- The number of marks is given in brackets [ ] at the end of each question or part question.
- The total number of marks for this paper is **60**.
- You are advised to spend about 20 minutes on Section A and 40 minutes on Section B.
- The values of standard physical constants are given in the Data, Formulae and Relationships Booklet. Any additional data required are given in the appropriate question.
-  Where you see this icon you will be awarded marks for the quality of written communication in your answer.  
This means, for example, you should
  - ensure that text is legible and that spelling, punctuation and grammar are accurate so that meaning is clear;
  - organise information clearly and coherently, using specialist vocabulary when appropriate.
- This document consists of **16** pages. Any blank pages are indicated.

Answer **all** the questions.

### Section A

- 1 The two columns list the usual units of four electrical quantities and a set of equivalent alternative units.

units	equivalents
A	$J\ s^{-1}$
V	$V\ A^{-1}$
W	$C\ s^{-1}$
$\Omega$	$J\ C^{-1}$

Draw a straight line from each **unit** box to the matching **equivalent** box.

[3]

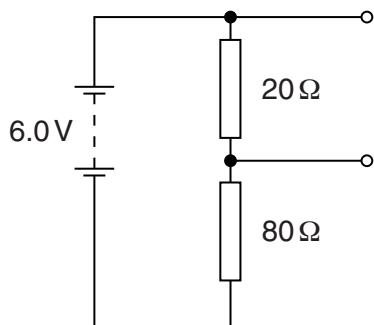

- 2 The two columns list four mechanical properties of materials and a set of definitions.

properties	definitions
stiff	the force per unit cross-sectional area
stress	difficult to indent or scratch
hard	a small strain for a large stress on a material
tough	needs a large energy to break and create a new fracture surface

Draw a straight line from each **property** box to the correct **definition** box.

[3]

- 3 Two resistors are connected in series to a 6.0V supply of negligible internal resistance. Study Fig. 3.1.

**Fig. 3.1**

- (a) Show that the p.d. across the  $20\Omega$  resistor is greater than 1V.

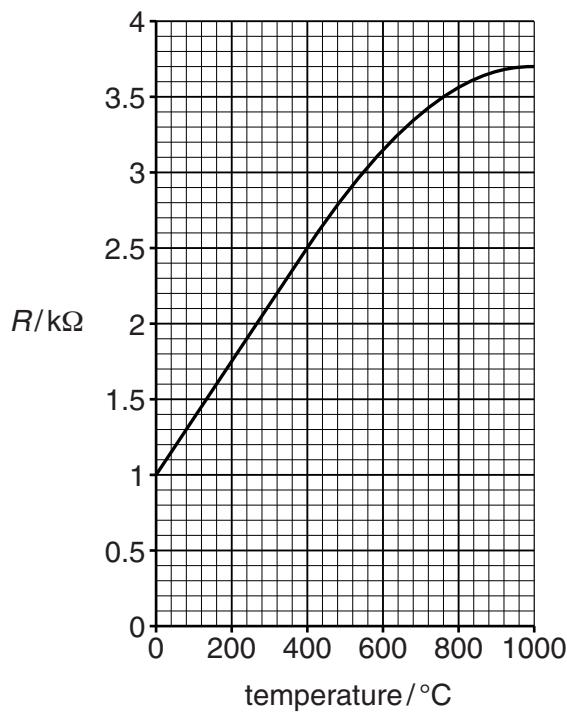

[2]

- (b) Calculate the power dissipated in the  $20\Omega$  resistor.

$$\text{power} = \dots \text{W} [2]$$

- 4 A resistance thermometer uses changes in resistance with temperature to measure temperature.

Fig. 4.1 shows the calibration graph of the thermometer's resistance against temperature.

**Fig. 4.1**

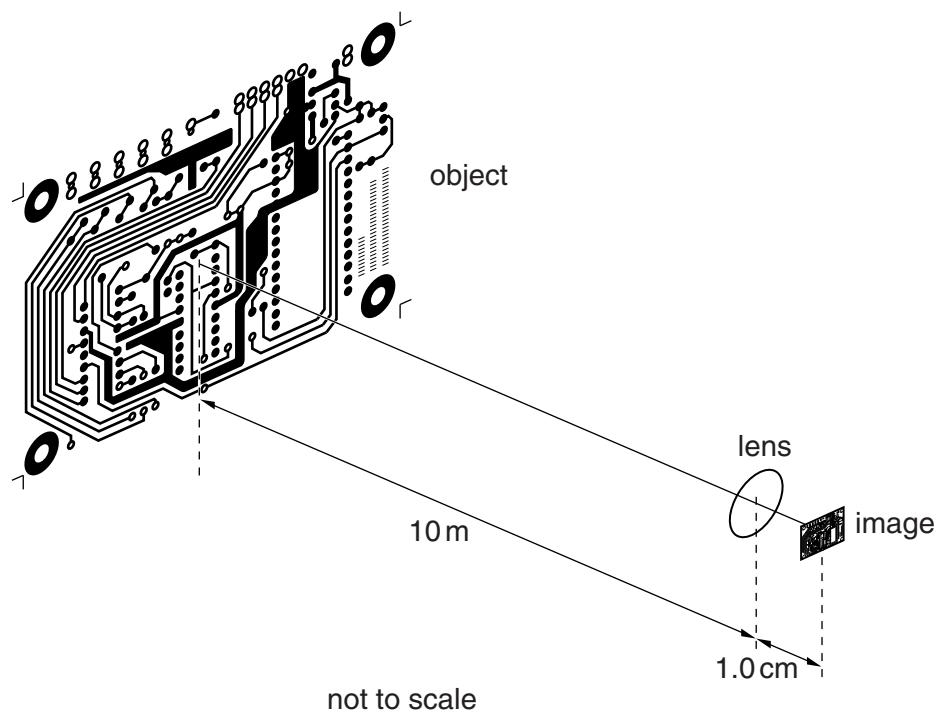

- (a) Calculate the sensitivity of the thermometer at 200 °C.

$$\text{sensitivity} = \dots \Omega^{\circ}\text{C}^{-1} [2]$$

- (b) Describe what happens to the sensitivity of the thermometer as the temperature increases from 0 °C to 1000 °C.

[2]

- 5 Fig. 5.1 shows the production of a tiny image using a lens system to make a micro-circuit.

**Fig. 5.1**

- (a) Calculate the magnification of the lens system using the data in Fig. 5.1.

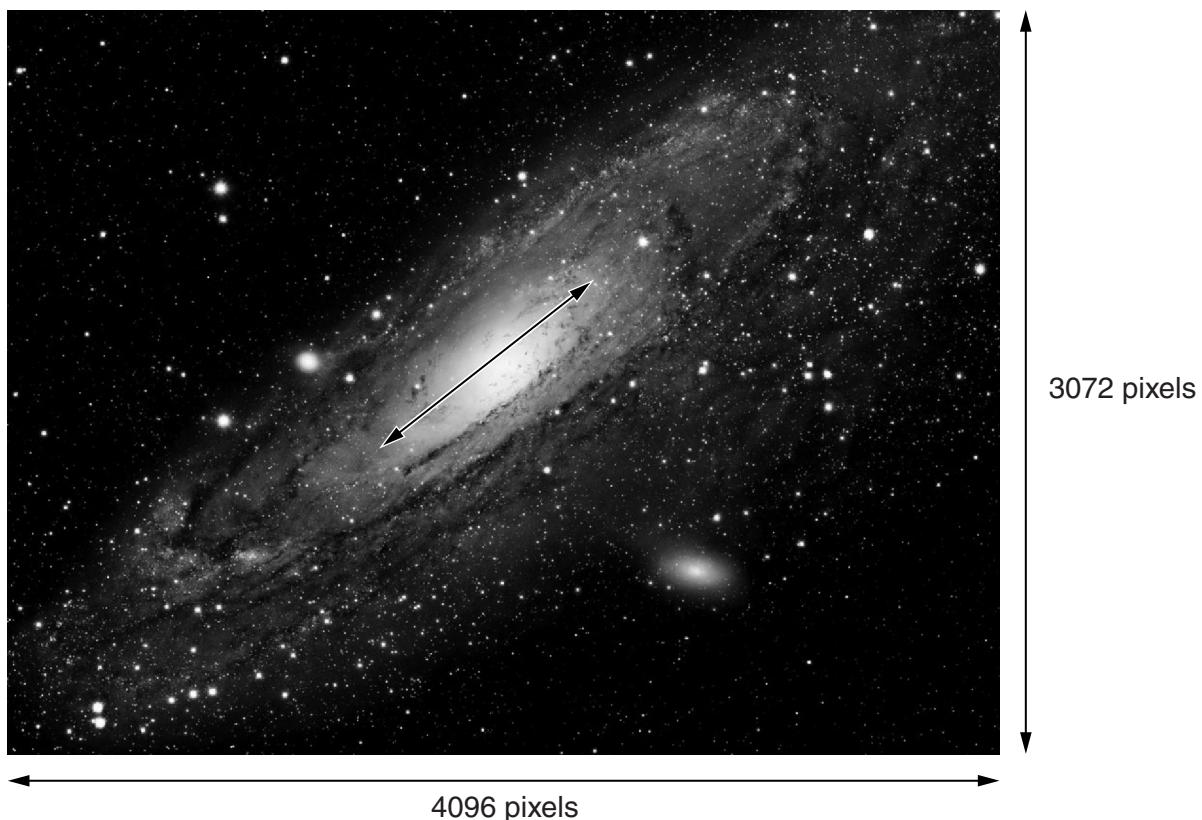

$$\text{magnification} = \dots \quad [2]$$

- (b) Calculate the power of the lens needed to achieve this magnification.

Clearly show your working.

$$\text{power} = \dots \quad D \quad [3]$$

- 6 Fig. 6.1 shows an image of the Andromeda galaxy taken by the Hubble Space Telescope. The image contains  $4096 \times 3072$  pixels as shown.

**Fig. 6.1**

The resolution of the image is 30 light years per pixel.

Calculate the diameter of the galactic nucleus indicated by the arrow in Fig. 6.1.

Clearly show your working.

$$\text{diameter} = \dots \text{light years [3]}$$

7 Here is a list of numbers.

0.005      0.05      0.5      5.0      50

Write down the number from the list which is the nearest estimate for:

(a) the breaking strain of a rubber band ..... [2]

(b) the power in kW for a 'one cup' kettle ..... kW  
[2]

**[Section A Total: 24]**

**Section B**

**8** This question is about stretching polythene.

- (a) A long narrow sample strip of polythene is cut from a shopping bag. It stretches elastically up to a strain of 0.082 at a stress of 14 MPa. This is the elastic limit of the material.

- (i) Calculate the Young modulus of the polythene. State the unit.

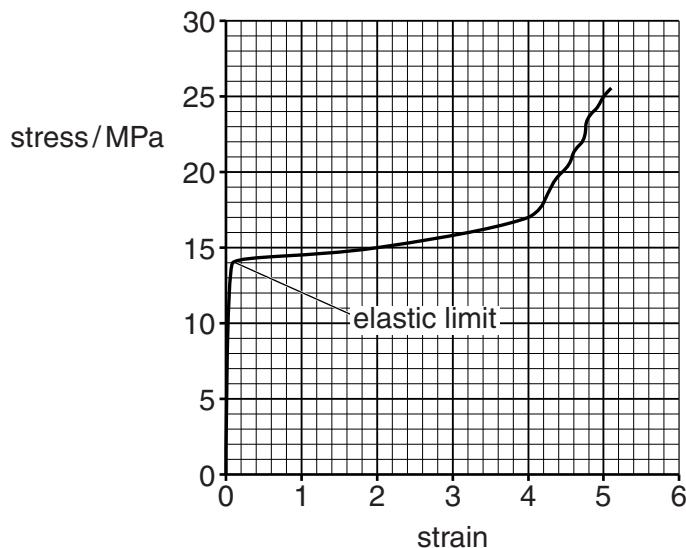

$$\text{Young modulus} = \dots \text{unit} \dots [3]$$

- (ii) The cross-sectional area of the sample is  $1.9 \times 10^{-7} \text{ m}^2$ .

Calculate the force applied to the sample of polythene to produce a stress of 14 MPa.

$$\text{force} = \dots \text{N} [2]$$

- (b) Fig. 8.1 shows the stress against strain graph for the sample of polythene up to its breaking point.

**Fig. 8.1**

- (i) Describe the behaviour of the sample of polythene as it is stretched from the elastic limit to its breaking point.

[2]

- (ii) Calculate the extension of the sample at the breaking point. Use Fig. 8.1.

The original length of the sample is 15 cm.

extension = ..... cm [3]

- (c) Stress is increased slowly to the sample of polythene between the elastic limit and the breaking point.

Suggest and explain what is happening to the **long chain molecules** in the sample.

You may wish to use labelled diagrams.

*In your answer you should use appropriate technical terms spelled correctly.*

**10**

- 9 One method of calibrating a voltmeter is to measure the known p.d. across a standard cell. A standard cell is one whose emf is stable and accurately known.

One such standard cell has an emf  $\varepsilon$  of 1.019V at room temperature.

- (a) State the number of significant figures in this emf value.

number of significant figures = ..... [1]

- (b) The uncertainty in the emf is given as  $1.019 \pm 0.001$ V.

Calculate the % uncertainty suggested by this data.

% uncertainty = ..... % [1]

- (c) The p.d. across the cell may change if the current exceeds  $2.8\text{ }\mu\text{A}$  or if more than  $10\text{ }\mu\text{C}$  of charge are drawn in any measurement.

The internal resistance of the standard cell is  $350\Omega$ .

- (i) In a particular voltmeter calibration by a student the current drawn is  $1.1\text{ }\mu\text{A}$ .

Show that the maximum time the student has is less than 10s in which to complete the measurement.

[2]

- (ii) Calculate the resistance of the voltmeter being calibrated.

Clearly show your working.

resistance of voltmeter = .....  $\Omega$  [3]

- (iii) Calculate the voltage drop across the internal resistance of the standard cell during the calibration.

voltage drop = ..... V [2]

- (d) Suggest and explain a problem that would happen in an attempt to calibrate a voltmeter of much lower internal resistance using this standard cell.

[2]

[Total: 11]

- 10 This question is about a 3-D television system.  
The TV screen contains  $1920 \times 1080$  colour-pixels.  
Each colour-pixel consists of three sub-pixels, one red, one green and one blue.
- (a) (i) The intensity of light emitted by each sub-pixel in the screen is coded by a 12 bit number.

Calculate the number of alternative intensities for each sub-pixel.

$$\text{number of intensities} = \dots \quad [1]$$

- (ii) Show that to produce one image on the screen about 75 Mbits of uncompressed information are needed.

[1]

- (iii) 120 images are displayed on the screen each second.

Estimate the bandwidth required for transmission of uncompressed image data for this TV system. Clearly show your working.

$$\text{bandwidth} = \dots \text{ Hz} \quad [2]$$

- (b)** Light emitted from the 3-D TV screen is unpolarised.  
To produce a 3-D effect viewers wear glasses containing polarising filters.

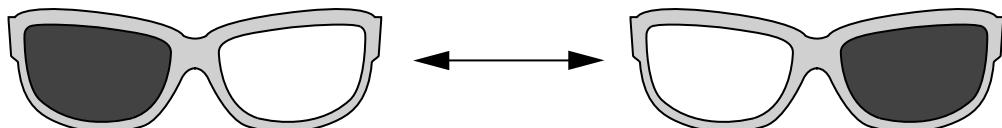

- (i)** Explain the difference between unpolarised and polarised light.

You should use labelled diagrams in your explanation.

**[3]**

**Please turn over for question 10(b)(ii).**

- (ii) The images on the TV screen alternate between the views which should be seen by the left and right eyes. An electronic signal to the glasses causes the light to be blocked alternately to the left and right eyes. This signal is synchronised with the TV images. See Fig. 10.1.
- Each eye sees 60 frames per second. Then the brain integrates these into a single 3-D image with no flicker.

active 3-D glasses blank out left vision when the right eye frame is displayed on the TV

then blanks out right vision when the left eye frame is displayed

**Fig. 10.1**

Each lens contains two polarising filters. One filter has a fixed plane of polarisation. The other filter is made from a liquid-crystal material. This material acts as a polarising filter when a voltage is applied across it.

Suggest and explain how the glasses alternately block the light to the left and right eye. Use your knowledge of polarisation.

*Organise your explanation clearly and coherently.*
