

Physics B (Advancing Physics)

OCR Advanced GCE H559 Unit G496 (a) Practical Investigation Coursework Assessment Form

Examination session	June
---------------------	------

Year	2	0		
------	---	---	--	--

Centre name					
-------------	--	--	--	--	--

Centre number					
---------------	--	--	--	--	--

Candidate name				Candidate number			
----------------	--	--	--	------------------	--	--	--

**A copy of this sheet must be attached to each candidate's work as a record of the assessment.
The full criteria on which the assessment should be based can be found in the Teacher Support:
Coursework Guidance.**

INSTRUCTIONS FOR COMPLETION

- 1 Each of these forms should be completed for each candidate for each of parts (a) and (b) of this unit.
- 2 Please ensure that the appropriate boxes at the top of the forms are completed.
- 3 Enter the mark awarded for each coursework task in the appropriate box.
- 4 Add the marks for all the coursework tasks together to give a total out of 20.
- 5 Sign and date the forms.

	5	3	1
A Approach and experimental skill	<p>(i) Initial plan There is a clear analysis of the problem in terms of underlying physics. Appropriate variables are identified. The initial approach and methods are well chosen</p> <p>(ii) Careful methodical work Methods and approach are well chosen. An appropriate risk assessment is carried out. The work is done methodically and systematically, and with data recorded carefully and accurately as they are taken.</p> <p>(iii) Practical competence and skill Considerable skill and care is used to obtain results that are as good as possible, and to reduce uncertainty and avoid systematic error.</p>	<p>The definition of the problem is sound but lacks some detail. There are limited ideas about how to get started.</p>	<p>The problem has been defined in simple terms. Help is needed to get started.</p>
B Progress, independence, use of physical thinking	<p>(i) Use of physics The student uses sound knowledge of physics to make decisions about the progress of the investigation beyond the initial plan.</p> <p>(ii) Independence The student makes very good progress, showing initiative and actively seeking and making use of advice.</p> <p>(iii) Progression of experiments A good range of experiments showing progression and development, responding to problems or effects found. The work will often be limited only by the time available.</p>	<p>Some knowledge of relevant physics is demonstrated, but is not fully utilised in making decisions about the progress of the investigation.</p> <p>The student requires some guidance in order to progress, or is limited in progress due to not seeking guidance when appropriate</p> <p>A related set of experiments, or several variables in one experiment are investigated</p>	<p>The work is largely empirical.</p> <p>The student requires considerable guidance or demonstrates little engagement with the task.</p> <p>Experimental work is limited or lacking in demand.</p>
	/5		

	5	3	1
C Quality and presentation of observations	<p>(i) Collection and recording of data A good range of data, including repeated observations where necessary, is collected and displayed clearly with correct headings, units, tolerances and significant figures. Thought is given to design and presentation of tables.</p> <p>(ii) Graphical plots and other representations of data Graphical plots are well chosen to display the data to best effect. Labelling, uncertainty bars and best fit lines are used appropriately. The message conveyed by plots is stated clearly (perhaps in a caption)</p> <p>(iii) Quality of the report The report is concise, well written and adds value to the investigation with good structuring and clear illustrations and referencing</p>	<p>A satisfactory range of data is collected and displayed clearly. There may be inconsistencies in the use of headings, units or significant figures.</p>	<p>The data may be limited in quantity or range. There may be serious shortcomings in the clarity of the presentation of the data.</p>
D Conclusions and evaluation	<p>(i) Analysis of data The data is analysed in depth to allow the student to propose relationships between the variables under investigation. Where possible results of analysis are cross-checked against other analysis or data.</p> <p>(ii) Interpretation of data There is a detailed discussion of the outcomes of the investigation explaining them in terms of relevant physics. Uncertainty of measurements and is estimated from spread of data or from tests on instruments. Possible systematic errors are identified, and if possible corrected for.</p> <p>(iii) Evaluation Uncertainties in conclusions are discussed in terms of the limitations of the procedures used. Anomalies are noted and discussed or dealt with.</p>	<p>Some valid calculations of derived quantities are attempted and outcomes stated</p>	<p>The analysis is limited to direct comparisons or plots of measured data.</p>
