
Glossary: Unit 14 Developing and Creating Websites

Term	Definition/Explanation
Commercial websites	These may be any websites that have influenced the ultimate design of the candidate's website. This influence may be positive, in that some direction may be seen as having been taken from the website, or negative, in that the candidate chose not to include various elements because they were perceived as being inappropriate to the candidate's final website. The websites evaluated should be commercially produced.
Critical analysis	The candidate will be assessed on how well they are able to self-evaluate. Candidates need to show that others have visited their website and that comments made by those visitors have, where necessary, been acted upon. Candidates should also evaluate the personal role they played in completing the final product, and how they might amend the approach they took were they to repeat the task.
Design notes	These should be plans of the website, showing which elements will be combined to create the whole. Section 14.2.3 of the specification lists the tools available to candidates to carry out this task.
HTML format	Web pages printed out in code format
Multiple-page website	Candidates need to produce a website of at least three pages
Script commands	This refers to candidates using HTML code to produce various effects on their websites.
Test plan	Candidates need to show that they have tested all aspects of their website, ranging from issues to do with navigating the product in a pre or user defined order, through to whether individual images are correctly displayed or that text appears correctly. The test plan should show what is to be tested, how that element will be tested and the expected result. Once both the test plan and the final product have been completed, the planned testing should be carried out and the test plan record completed to show the actual result of the test and any further action that was required in order to put right any problems.
WYSIWYG format	Web pages printed out as they would be seen if the viewer were using a web browser.
