## Human Health and Fitness

Tuesday 21 June 2005 – Morning

Time: 1 hour 30 minutes

## **Instructions to Candidates**

In the boxes above, write your centre number, candidate number, your surname, initial(s) and signature.

The paper reference is shown above. Check that you have the correct question paper.

The paper reference is shown above. Check that you have the  
Answer ALL questions in the spaces provided in this booklet.

Show all the steps in any calculations and state the units. Calculators may be used.

Show all the steps in any calculations and state the units.  
Include diagrams in your answers where these are helpful.

## **Information for Candidates**

The marks for the individual questions and parts of questions are shown in round brackets: e.g. (2). The total mark for this question paper is 70.

### **Advice to Candidates**

You will be assessed on your ability to organise and present information, ideas, descriptions and arguments clearly and logically, taking into account your use of grammar, punctuation and spelling.

**Answer ALL questions in the spaces provided.**

1. (a) The table below compares three features of nervous and hormonal coordination. Complete the table to show the differences between the two types of coordination.

Feature	Nervous coordination	Hormonal coordination
Method of transmission		
Speed of transmission		
Duration of the response		

(3)

- (b) Give **one** similarity between the methods of transmission involved in nervous and hormonal coordination.

.....  
.....  
.....  
.....

(1)

**(Total 4 marks)**

**Q1**

Leave  
blank

2. In humans, physical exercise results in the breakdown of glycogen in muscle tissue.

(a) Name the hormone that is secreted in response to the anticipation of physical exercise.

(1)

- (b) This hormone causes the breakdown of glycogen which is stored in the cells of the liver and the muscles. Some scientists think that the effect of the hormone may be greater in the muscles than in the liver.

Suggest why this effect would be advantageous to someone who is about to undergo some exercise.

(4)

- (c) Name the hormone that will lower the blood glucose level, if it is too high after the exercise.

Leave  
blank

3. The flow diagram below shows some of the steps involved in glycolysis and the Krebs cycle. Some ATP is made directly. Hydrogen is also released and this can result in the production of more ATP.

Leave  
blank

- (a) Describe how the hydrogen released during glycolysis and the Krebs cycle results in the production of ATP.

.....  
.....  
.....  
.....  
.....  
.....  
.....  
.....

(4)

- (b) Using the information in the diagram, state the number of ATP molecules produced from **one** triose phosphate molecule.

.....

(1)

- (c) As well as carbohydrates, triglycerides can be respired. The first step is to break down each triglyceride molecule into glycerol and three fatty acids.

Each fatty acid is broken down into acetyl CoA molecules. The acetyl CoA molecules then enter the Krebs cycle.

- (i) Using the information in the diagram, state the number of ATP molecules produced from **one** acetyl CoA molecule.

.....

(1)

- (ii) Suggest why fatty acids can only be respired under aerobic conditions.

4. An investigation was carried out into the effect of antidiuretic hormone (ADH) on urine production in a mammal. The rate of urine production was measured over a period of 30 minutes. Five minutes after measurements began, ADH was injected into a vein of the mammal. The results are shown in the graph below.

- (a) Name the gland that releases ADH.

(1)

- (b) Describe the effect of the injection of ADH on the rate of urine production in the mammal in this investigation.

(3)

Leave  
blank

- (c) Describe the mechanism by which ADH produces the effect seen in this investigation.

(4)

- (d) In a similar investigation, an injection of sodium chloride (salt) solution was given after five minutes instead of ADH. This injection was observed to affect urine production in a similar way to ADH. Suggest how the sodium chloride brought about this effect.

9. The diagram below illustrates some aspects of the regulation of heart rate.

- (a) Complete the flow diagram by naming the part of the heart that receives impulses from the two nerves. **(1)**
- (b) Strenuous physical activity will increase the volume of blood flowing through the venae cavae and into the right atrium. This will trigger a reflex action.
- (i) Name the reflex that will be initiated.

.....  
**(1)**

Leave  
blank

- (ii) Using your own knowledge and the information provided, explain how this increase in blood volume in the venae cavae and right atrium causes a change in heart rate.

.....  
.....  
.....  
.....  
.....  
.....  
.....  
.....

(3)

- (c) The coordination of the heart beat is disrupted when the conducting systems of the heart are damaged. This type of disease is called heart block. Describe how an artificial pacemaker can be used to treat this condition.

.....
