Unit 3 Paper 03

Wednesday 10 January 2007 - Morning

Time: 1 hour

| Materials required for examination | Items included with question paper |
|------------------------------------|------------------------------------|
| Ruler | Nil |

Instructions to Candidates

In the boxes above, write your centre number, candidate number, your surname, initial(s) and

The paper reference is shown above. Check that you have the correct question paper.

Answer ALL THREE questions in the spaces provided in this booklet.

Show all the steps in any calculations and state the units. Calculators may be used.

Include diagrams in your answers where these are helpful.

Information for Candidates

The marks for individual questions and parts of questions are shown in round brackets: e.g. (2). The total mark for this question paper is 38.

Advice to Candidates

You will be assessed on your ability to organise and present information, ideas, descriptions and arguments clearly and logically, taking account of your use of grammar, punctuation and spelling.

Total

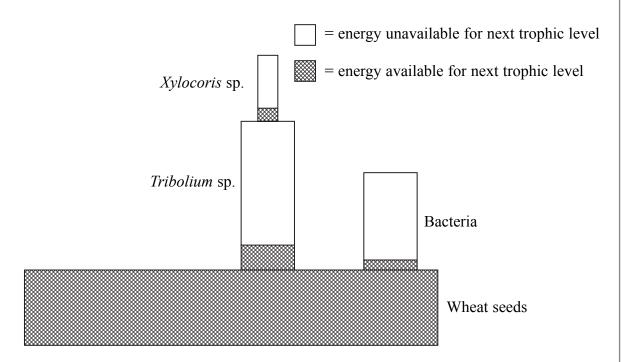

Answer ALL questions in the spaces provided.

1. After harvesting, wheat seeds may be stored for several months.

During storage, a proportion of the seeds will be lost. Most of this loss is due to two causes. The flour beetle, *Tribolium* sp., feeds on live dormant seeds and bacteria decompose dead seeds.

Many of the flour beetles are eaten by carnivorous insects called *Xylocoris* sp.

The diagram below shows the relative energy flow within a wheat store.

(a) State a suitable unit used to record the energy content of the wheat seeds.

(1)

(b) Using the information above, complete the table below by writing appropriate terms in the spaces.

| Organism | Trophic level | Mode of nutrition |
|---------------|--------------------|-------------------|
| Wheat seeds | | |
| Tribolium sp. | Primary consumer | Heterotrophic |
| Xylocoris sp. | Secondary consumer | |
| Bacteria | | Heterotrophic |

(2)

| (ii) Suggest why all of the energy in the wheat seeds is available to be passed on the next trophic level. | is not available to be passed on to <i>Xylocoris</i> sp. |
|--|--|
| (ii) Suggest why all of the energy in the wheat seeds is available to be passed on the next trophic level. | |
| (ii) Suggest why all of the energy in the wheat seeds is available to be passed on the next trophic level. | |
| (ii) Suggest why all of the energy in the wheat seeds is available to be passed on the next trophic level. | |
| (ii) Suggest why all of the energy in the wheat seeds is available to be passed on the next trophic level. | |
| (ii) Suggest why all of the energy in the wheat seeds is available to be passed on the next trophic level. | |
| (ii) Suggest why all of the energy in the wheat seeds is available to be passed on the next trophic level. | |
| (ii) Suggest why all of the energy in the wheat seeds is available to be passed on the next trophic level. | |
| (ii) Suggest why all of the energy in the wheat seeds is available to be passed on the next trophic level. | |

2. In an investigation, several leaves were removed from a Magnolia tree. These leaves were weighed and then placed on the surface of some moist compost in an incubator set at 25 °C. At two-day intervals for a period of 4 weeks, the leaves were weighed and then replaced on to the surface of the compost.

3. Armenia, a small country in Asia, experienced considerable political and economic changes during the last part of the twentieth century. One of the major problems for Armenia is the supply of energy resources for both domestic and industrial use. From 1990 to 1993, as a result of increased demand for energy, tens of thousands of hectares of Armenian forest were cut down for use as fuel.

The main native species of trees that were removed during this period were beech, oak and hornbeam. These are relatively slow-growing species that cannot be replaced quickly. Beech, oak and hornbeam produce high quality wood, usually used in the construction industry. The extensive deforestation during this period has led to considerable environmental problems such as soil erosion.

Since 1994, a project has been in progress in Armenia to evaluate the use of biomass from fast-growing poplar trees as an energy source for domestic fuel and for the generation of electricity. In the project, different forms of poplar, known as hybrids, were grown at several sites in different regions of the country. For each hybrid, the growth rate was recorded.

Some of the results of this study are shown in Figure 1.

Figure 1 – Growth rates of poplar hybrids at four different sites

| Site | Poplar hybrid | Growth rate /tonnes ha ⁻¹ year ⁻¹ |
|------------|---|---|
| Yerevan | DN-55 Jiacometti Eugenei Tripolo | 3.13 8.08 7.08 16.85 |
| Hrazdan | DN-55 Jiacometti Eugenei Tripolo | 3.73 6.30 9.08 1.83 |
| Tsovinar | DN-55 Jiacometti Eugenei Tripolo | 9.15 2.93 1.15 10.85 |
| Yeghegnute | DN-55 Jiacometti Eugenei Tripolo | 0.85 1.78 0.93 1.55 |

In order to generate electricity, the poplar wood biomass must be prepared as a fuel to drive steam turbines. The first stage in this process is to produce finely-divided woodchips.

The heat to drive the turbines can be generated in two different ways. The wood chips can be burned directly or gas can be released from the wood chips through a process called gasification. This gas is then burnt to release heat.

Leave blank

Figures 2 and 3 show the mass of wood chips required to produce 1 GJ of electricity by these two processes.

Figure 2 – Flow Chart for the Generation of Electricity by direct Combustion of Wood Chips
