

Examiners' Report June 2022

GCE Biology B 9BI0 02

Edexcel and BTEC Qualifications

Edexcel and BTEC qualifications come from Pearson, the UK's largest awarding body. We provide a wide range of qualifications including academic, vocational, occupational and specific programmes for employers. For further information visit our qualifications websites at <u>www.edexcel.com</u> or <u>www.btec.co.uk</u>.

Alternatively, you can get in touch with us using the details on our contact us page at <u>www.edexcel.com/contactus</u>.

ResultsPlus

Giving you insight to inform next steps

ResultsPlus is Pearson's free online service giving instant and detailed analysis of your students' exam results.

- See students' scores for every exam question.
- Understand how your students' performance compares with class and national averages.
- Identify potential topics, skills and types of question where students may need to develop their learning further.

For more information on ResultsPlus, or to log in, visit <u>www.edexcel.com/resultsplus</u>. Your exams officer will be able to set up your ResultsPlus account in minutes via Edexcel Online.

Pearson: helping people progress, everywhere

Pearson aspires to be the world's leading learning company. Our aim is to help everyone progress in their lives through education. We believe in every kind of learning, for all kinds of people, wherever they are in the world. We've been involved in education for over 150 years, and by working across 70 countries, in 100 languages, we have built an international reputation for our commitment to high standards and raising achievement through innovation in education. Find out more about how we can help you and your students at: www.pearson.com/uk.

Introduction

The examiners were impressed with the high standard of many exam papers. The general standard was higher than previous sessions and candidates and centres should be commended for their hard work in preparing for these exams despite the disruption to their education caused by the government response to a viral pandemic. It was clear that many candidates had prepared very thoroughly for these examinations and had developed an excellent grasp of all the topic areas covered. Factual knowledge was generally very strong, although some candidates occasionally did not use accurate, scientific terminology. As a general rule, candidates should always try to use technical language and when doing so, they should ensure that they use it accurately. Mathematical skills were generally very good, although some candidates found using the Hardy-Weinberg equation to determine the number of heterozygotes in a population very challenging. The examiners felt that there was an improvement in the quality of answers to data analysis questions and candidates seem to understand that they often need to apply their knowledge to unfamiliar situations. A minority of candidates still find it difficult to appreciate what certain command words mean. 'Discuss' requires a full exploration of all aspects of a question and 'evaluate' requires both sides of an argument to be considered before drawing a conclusion. The Advance Information clearly helped candidates to prepare certain topic areas as many scored highly on topics that were listed, such as the function of the retina.

Question 1 (b)

This question asked candidates to name three enzymes involved in DNA replication and describe their functions. Strong answers listed DNA helicase, DNA polymerase and DNA ligase and went on to give an accurate description of the function of each. Many candidates gave insufficient detail when describing the function of DNA polymerase, simply stating that it adds nucleotides or forms hydrogen bonds – a reference to the formation of phosphodiester bonds between neighbouring nucleotides was required. Descriptions of the function of DNA ligase were also often slightly vague with many referring joining nucleotides rather than joining fragments of DNA. Most candidates gained at least one mark with many going on to gain all three. A few candidates confused DNA replication with the process of transcription and referred to RNA polymerase and RNA formation.

(b) Describe the roles of three named enzymes involved in DNA replication.

DNA heurcase catalyses love formation of hydragen bands between complementary bases (Admine and buymine, cytosine and granore). DNA polymenase calalyses the formation of phosphodiester bonds between thosphate group and ribose sugar. DNA lique contalyces the nucleotides

This answer scored one mark for the role of DNA polymerase forming phosphodiester bonds. All three enzymes are listed but the functions of DNA helicase and DNA ligase are not correct.

Take care to give descriptions with A level standard detail and use accurate language. Sometimes an answer can be correct but does not have the required detail expected at A level. (3)

(b) Describe the roles of three named enzymes involved in DNA replication.

(3)

(3)

-DNA hericase breaks down the hydrogen bonds thus seperating the DNA Strands - DNA polymerase helps link adjacent nucleonder together via phosphodiester bonds - DNA ligase helps link gaps of DNA sections avong me phonophodiester backbone togemer.

(b) Describe the roles of three named enzymes involved in DNA replication.

· DNA Relices - unwinds and unzips the parts double halix in parts

· ENA 200 Polynerase - attaches the complementary bases to template strend

· DNA ligase - 'gluer' the chazaki fraquents together - fills is gaps

This answer gained two marks. Correct functions are given for DNA helicase and DNA ligase. The function of DNA polymerase lacks sufficient detail.

Question 1 (c)

This question assessed candidates understanding of the base pair rules and also mathematical skills. Most candidates gained at least one mark. Some candidates calculated that 15% of the nucleotides would be cytosine but did not then use this to determine the actual number of nucleotides.

Question 2 (a)(ii)

This question assessed candidates' understanding of the action of steroid hormones. Although most candidates are not familiar with how auxin exerts its effects, the question stated that auxin acts in the same way as oestrogen. Strong answers explained how auxin would bind to a receptor protein, that the receptor protein would then change shape and act as a transcription factor binding to DNA and stimulating RNA production. Many candidates scored one mark but only a few went on to gain all three. A significant number of candidates confused the action of steroid hormones with hormones that work via a second messenger.

(ii) Some types of auxin affect the activity of cells in the same way as hormones such as oestrogen affect human cells.

These auxins pass through the cell membrane and affect the synthesis of enzymes.

Explain how these auxins affect the synthesis of enzymes.

(3)

auxins promote can elongeition. awing bind to transcription factors involved in gene activation. This tage prometor regions and therefore syntheris of entrym transcription

This answer gained one mark for the binding of the auxin to the transcription factor. The candidate has used a lot of key vocabulary in their answer but there is either a lack of detail (eg promoter region is not linked to DNA) or slight inaccuracies (enzymes are synthesised by transcription).

Results Plus

When using scientific vocabulary, it is important to use it accurately. It is not enough to have all the correct words if they are in the wrong places.

(ii) Some types of auxin affect the activity of cells in the same way as hormones such as oestrogen affect human cells.

These auxins pass through the cell membrane and affect the synthesis of enzymes.

Explain how these auxins affect the synthesis of enzymes.

(3)recor Attesos allows In more the £0 K 80 WI ions amino ac aroug am C ar ponolina with in change chahae ror allino Hanslation IS no

This answer gained no marks. Although the candidate has stated that the auxin binds to a receptor, it is not clear that the receptor is within the cell. The rest of the answer is incorrect.

Question 2 (b)

This question discriminated well. Many excellent answers were seen that identified key data patterns including the increased germination rate if the last colour of light was red, although few candidates recognised that the number of exposures had no effect. Stronger answers referred to the overlapping or non-overlapping of the standard deviations and explained what this meant in terms of difference in means. Stronger answers also went on to state that for germination to occur, P _R form of phytochrome needs to be converted to the P _{FR} form. Some candidates gave vague answers, for example, many stated that 'red light had more effect' rather than stating that the last colour being red increased germination rates. A significant number of candidates did not mention the role of phytochrome. Although the role of phytochrome in seed germination is not listed in the specification, candidates should be able to apply their knowledge of phytochrome in flowering of plants to other situations.

Analyse the data to comment on the effect of red (R) and far-red (FR) light on the germination of lettuce seeds.

(4)

the mean greater. UL averall ricardy the torns re, under has red light preser indicates Jerts Printo active CCN NO. ja vor, au uption ... P.A.A presented Seeds Standard diviation noution. aura indication varied; this could limit overall conclusion datta

This is a good answer that gains two marks. The candidate clearly states that germination rates are higher when the last light colour is red and explains how this affects phytochrome. Although the standard deviations are mentioned, the significance of the overlaps is not explained.

If standard deviations are shown, always look for overlaps.

Analyse the data to comment on the effect of red (R) and far-red (FR) light on the germination of lettuce seeds.

(4)

when red light if the last light received, the mean number of Seeky that germinate is higher than when for red light is the cost light received. This is because of a d fries Carrille the conversion of & & the inactive phytochrome or both adire phytochrome pfr which flambater germination. they the more for return particles and hald by that plante with red light of the light here exported to the lengermation . For example, is a sequence of R, FR, R, FR, R, my in Fridy Sten ceedy germated compared to a Genueran R. F.R. R. This y because less PEC was prepert

This is a strong answer that gains three marks. The candidate clearly states that red being the last light colour increases the germination rate and then goes on to explain that P_R is converted to P_{FR} and then explains that it is the high level of P_{FR} that stimulates germination.

Analyse the data to comment on the effect of red (R) and far-red (FR) light on the germination of lettuce seeds.

The number of seeds that germinated depended on the type of light share on the seeds. when the last last light shone was Red light able the mean number of seeds around 43. All had the same as their Standard deviation was overlaps so the results aren't different from each other. This is due to Pr being converted to per in red light and per is the active form of phytodwane. When for red was shone last less seeds germinated as only 6 geninated in a par second sequence and 10 in le ath sequence. The sterdard deviation overaps slighty. His shows AS ppris converted into pr linactive implies pr inhibits gernigation and pr stimulates germination

This is an excellent answer that gained all four marks. The significance of the final colour of light is discussed, a correct statement about the overlapping standard deviations is given and the conversion and P_R to P_{FR} is explained along with how P_R must inhibit germination.

(4)

Question 3 (a)(iii)

This was well answered by many candidates although a significant number did not give enough detail to gain both marks. The question asked candidates to explain the function of lysosomes so that a reference to lysosomes containing enzymes along with a role of these hydrolytic enzymes was needed. Candidates should try to use scientific vocabulary such as hydrolysis rather than referring to 'breaking down.'

(2) ynnaa facta πQ DIC May ound while blood cells, such as madophages, used In recease digestive Phagoaltoxs to to break days pamogens. ysozymes called

(iii) Explain one function of lysosomes.

This answer gains two marks for the idea that lysosomes contain digestive enzymes and that these enzymes digest pathogens.

Do not use the term 'break down', use terms such as digestion or hydrolysis.

Question 3 (b)(i)

This question was a mathematical calculation that required candidates to read from the graph, rearrange the equation and give the answer to two significant figures. Many candidates were able to correctly read from the graph although fewer were able to rearrange the equation. Most candidates are now confident in using significant figures and were able to gain a mark for use of significant figures in this question. Candidates should show all their working so that they may still gain some credit even if the final answer is incorrect.

(i) The ratio shown in the graph can be calculated using the formula

ratio = volume of nucleus total volume of cell – volume of nucleus

On day 2, the volume of the cell nucleus was 900 µm³.

Calculate the total volume of this cell on day 2.

Give your answer to two significant figures.

Answer 960 µm³

(3)

This is an excellent answer that gains all three marks. The candidate has shown all their working so that even if their final answer was incorrect, marks would be gained for other correct stages.

(i) The ratio shown in the graph can be calculated using the formula

ratio = volume of nucleus total volume of cell – volume of nucleus

On day 2, the volume of the cell nucleus was 900 µm³.

Calculate the total volume of this cell on day 2.

Give your answer to two significant figures.

 $\frac{16}{16} = \frac{16}{16} = \frac{16$

This answer gained two marks. The final answer was not given to two significant figures but the other steps were correct.

(i) The ratio shown in the graph can be calculated using the formula

 $ratio = \frac{volume of nucleus}{total volume of cell_{\Gamma} volume of nucleus}$ On day 2, the volume of the cell nucleus was 900 µm³. Calculate the total volume of this cell on day 2. Give your answer to two significant figures. (3)

rai

Answer 13 14000 µm³

Question 3 (b)(ii)

This question presented candidates with the changes in nucleocytoplasmic ratio of cells as early development proceeds. Candidates were asked to comment on the change in the ratios as time progressed. Most were able to gain at least one mark but only a few, very strong answers gained all three. Many candidates correctly stated that the ratio for all cells steadily increased up to three days. Many candidates then went on to state the ratio for trophectoderm cells then levelled off whilst the inner cell mass cells ratio decreased. Some candidates recognised that the reducing ratio was due to cells becoming smaller after divisions and some went on to explain that the two different cell types had differentiated and the ICM cells were then decreasing in size. Some candidates gave imprecise answers that did not refer to times, instead just giving vague statements about the lines going up and then levelling off.

(ii) Comment on the changes in the ratios as the zygote develops into a blastocyst.

ps the manser of certin increase, the poster barrior
alto increase. The the me ravio pegine to have a
sine in preater go pradient not on day 4 where 16 cens name begins to
developed, but however, the protect nopreviolerm & haves att on
May 4 on a lower ratio of 26 compared to the crus
partio of 46. and ma

(3)

(ii) Comment on the changes in the ratios as the zygote develops into a blastocyst.

This answer also gains two marks for identifying the increase up to day 3 and then the different growth of the two cell types after day 3.

Question 4 (b)(i)

Many candidates found this calculation challenging. Candidates had to use the graph to identify the pressure at the point when the atrioventricular valve closed (when the ventricle pressure increases above the atrial pressure). Many candidates selected the wrong point but were still able to gain marks due to error carried forward. After finding the pressure, candidates had to convert the area of the valve from cm² to m² and then rearrange the formula. A significant number of candidates were unable to convert the units correctly with many incorrectly assuming that there are 100 cm² in 1 m². Candidates should be careful when converting units.

(i) An atrioventricular valve in the healthy heart has a surface area of 3.5 cm².

Determine the force that is applied to this atrioventricular valve when it closes.

Use the formula

Prossure in kPa -	Force in newtons	
	Area in m ²	
0.8 kpg =	C	(3)
0	350	3.5 cm
×350	×350	× 100
		350 m
0.8 ×350 =	280	

Answer 280 newtons

(i) An atrioventricular valve in the healthy heart has a surface area of 3.5 cm².

Determine the force that is applied to this atrioventricular valve when it closes.

Use the formula

Pressure in kPa =
$$\frac{\text{Force in newtons}}{\text{Area in m}^2}$$

 $\frac{16 = F}{3.5}$
 $\frac{16 = F}{3.5 \times 10^{-4}}$
 $F = 56 \text{ KPa ms}^2$
 $F = 5.6 \times 10^{-3}$
 $3.5 \text{ cm}^2 = 3.5 \times 10^{-4}$
(3)

(i) An atrioventricular valve in the healthy heart has a surface area of 3.5 cm².

Determine the force that is applied to this atrioventricular valve when it closes.

Use the formula

Pressure in kPa =
$$\frac{\text{Force in newtons}}{\text{Area in } m^2}$$

 $\text{Cm} \xrightarrow{\mathbb{R}} \xrightarrow{\text{LOO}} m^2$
 $3 \cdot 5 \quad 350$
(3)
 $\text{Force = Pressure in KPa x Area in } m^2$
 $1 \cdot 4 \times 350$
 $= 490$

Answer 490 newtons

This answer gained one mark. The reading from the graph and unit conversion are both incorrect but the formula has been rearranged correctly.

Question 4 (b)(ii)

This question required candidates to compare the pressure differences in the atrium, ventricle, and aorta of a heart with a damaged valve with a healthy heart. The question discriminated well with most candidates gaining at least one mark for the idea of reduced oxygen transport to muscles. Many candidates also correctly referred to the backflow of blood into the atrium and recognised that the aortic pressure was lower. Some candidates did not gain full credit as their answers were vague. For example, the statement 'the damaged valve allows backflow of blood' gained no marks but the statement ' the damaged valve allows the backflow of blood from ventricle to atrium' would gain a mark. Candidates should always try to give precise answers that give as much detail as possible.

- After A the atrioventricular values (AV) close, people with AN value leaks, still have a much higher pressure in their left atrium compared to normal people-not m all the blood has passed into the ventrical: - With AV value leak, the a lower maximum, pressure is reached. - Blood of Oxygenated blood is to sent to the body under a lower hydrostatic pressure. - FFFVENEY of delivering oxygen to respiring tissues is lowered. - Rate of respiration lowered. - Rote of respiration lowered.

(4)

⁽ii) Explain why people with an atrioventricular valve that leaks find exercise difficult.

This answer gained three marks. The candidate correctly states that the ventricle pressure is lower and goes on to explain that there is a slower flow of blood to muscles and less ATP generated. A mark would not be awarded for transport of oxygen to tissues on line 11 but the candidate refers to muscles later in their answer.

Always give precise detail in answers. For example, do not just say that the AV valve stops backflow, say where it stops the blood flowing to.

(ii) Explain why people with an atrioventricular valve that leaks find exercise difficult.

Having an atioventicular value that leaks would cause there to be some loackflow of Islood when it is moving from the atrium to the ventricles. This would decrease the blood pressure, in th ventricles poursing according couvring less blood to be pumped through the gorta to the rest the body. The decreased blood pressure of also means black the contraction will have less force, meaning that blood will not reach the muscle groups used during exercise as efficiently This means that the watt be a The vale of respiration respiration (in) we axygen will not be provided to the as quickly and (Total for Question 4 = 9 marks) cause a descensed rate of verpir the muscles will not have rate of verpiration, efficiently and which means worle. 60 energy

This excellent answer gained four marks. The candidate clearly explains that there is backflow into the atria and then goes on to explain how pressure differences lead to reduced oxygen transport to muscles and respiration.

(4)

(ii) Explain why people with an atrioventricular valve that leaks find exercise difficult.

re may be back flow of blood or leasts as a result Asthe of faulty valves, the constant flaw of blood is irregular. there will not be the came amount of blood being purped around the body and to an norder muscles as there would be in a working value present body. The body met and heart must work harder and pring more to name maintain a required level of blood flow to reach the same level work as another would.

(4)

This answer gained no marks. The candidate correctly refers to the backflow of blood but does not state where the blood flows back to.

(ii) Explain why people with an atrioventricular valve that leaks find exercise difficult.

lealing arricular value results in blocd Maving a the atria from the ventricles. This Dacy pressure to increase during ventricular causes PU12 the graph. As USS Orygerated Vertricles, a smalle volume will forced out in the transported +4 body. Anto. aarta arcund blocd is unable Reduce exigerated scouide Su respiring MUSCLE resulting in them respiring CXYC lactic. When doing exercise, producing toxic OVU0900 increases in order much 10 for the OXYGEN circulating prevents verp contracting Claving ATP Hu production in the form nucle with pain O un andral

This excellent answer gained four marks. The candidate describes the effect of the damaged valve on the pressures in the heart and goes on to explain the consequences of this. The answer is also written in a logical way – candidates should be encouraged to think through their answers in logical steps.

(4)

Question 5 (b)

Many excellent, detailed, accurate answers were seen to this question. The retina was listed on the Advance Information and it was clear that many candidates and centres had prepared this topic well. Most were able to explain the breakdown of rhodopsin into opsin and retinal and many candidates gave impressive detail regarding the change between cis and trans retinal. Some candidates incorrectly suggested that opsin causes an increase in sodium ion diffusion into the rod cells, depolarisation, and neurotransmitter release. The examiners were impressed with the detailed knowledge shown by many candidates. Candidates should be careful to use correct symbols, for example, they should refer to Na⁺ rather than Na.

(3)

(b) Explain the role of rhodopsin in the generation of a nerve impulse in cell X when light falls on the retina.

	(3)
Rhodopsin is the photopignent sound in rodiers which are	Lee t
dim light. When light salls on the retine, chodopsin in	rodceus
is bleached and broken down into upon and retinal. a	PS:
blocks Nat Chanels so no glutomate Cinhibitory nerotrons	Mitter)

allowing the action potential to be triggered in Cell x wh	ich is
a biplar cell. Oue to Summation and netinal convergence, the	threshold
is mak a ther for rod cells so an action potatial lan occu	())
the ball of the Supplie and the belief	Decile
55 F 91. 5	

This excellent answer gained three marks. The candidate describes how light splits rhodopsin into retinal and opsin and then goes on to describe the closure of sodium channels and reduction in release of glutamate.

If candidates use the symbol for sodium ions, they should use Na⁺ not Na by itself.

(b) Explain the role of <u>rhodopsin in</u> the generation of a nerve impulse in cell X when light falls on the retina.

(3)ting rod alls have bleaching occurring broken down into refinal 3 Manin ton channy caus onto tramported still f rad cells - glutanuate is released - inhibitory depolarisa per 10ml

This answer gained two marks. The candidate correctly states that rhodopsin is broken down into opsin and retinal and goes on to refer to the closure of cation channels. The reference to increased diffusion of sodium and increased release of neurotransmitter is, however, incorrect. (b) Explain the role of rhodopsin in the generation of a nerve impulse in cell X when light falls on the retina.

 ${3}$ enough when "ight hits the shadopsin usual pigment, it be connects the as-retinal into trans-retinal. This conversion breaks down the rhodopsin who repaid and opsin two in a greaching called bleaching. The apsin baid to the cell supprise membrane and blocks the Nat Channels. The Nat pring norths of the same noto and triggers hyperperlaiscation. It enough bleaching will become so more regative, it reales the threshold and deurs it trigger gustante Mentopournitter to viley, to the bipoler nurone in an actin potential and this a news imputer . Velalfs. this

This answer gained three marks and illustrates the excellent use of technical terminology. The candidate correctly refers to the hyperpolarisation of the membrane and reduction in glutamate release.

(b) Explain the role of rhodopsin in the generation of a nerve impulse in cell X when light falls on the retina.

- Splits into opsin and retinal due to light on the retina Re Due to rod cells being blea - Rod cells are bleached - Sodium channels

This answer gained one mark. The candidate understood that rhodopsin splits into opsin and retinal but does not provide any further detail. (3)

Question 5 (c)

This level-based question discriminated well. Candidates were presented with the details of an experiment carried out to investigate the effect of different lengths of time spent in the dark on sensitivity of the retina. The experiment also used two colours of light, one of which stimulates cones and rods, the other only cones. Level three answers discussed the data, recognised that light with a wavelength of 620 nm does not stimulate rods cells but 500 nm does, explained why rod cells are more sensitive and explained why time in the dark increased rhodopsin resynthesis. Level two answers focussed on the data and either the effect of summation or the resynthesis of rhodopsin. Level 1 answers often ignored the data and gave generic descriptions of retinal function or presented answers with no explanation.

Some outstanding answers were seen that fully explained why rods are more sensitive than cones and why time in the dark increased sensitivity. To get level 2 or 3 marks, candidates had to relate the theory to the data. Some candidates only discussed one aspect of the experiment or gave no explanations.

Analyse the graphs to explain the results of this investigation. (6) The results show that the eye is much more receptive to the 620 nm light than the 500 nm light. As the minimum amount of light intensity was plateved For G20 at a much higher intensity than the SOO. This can be explained by the frequency wavelength of the Zight. The higher wavelength of the zight, the attege be a will have to do more to become more receptive to it. Also, after spending on extended amount of time in dorte, the photosensitive pigments within the eye such as chodopsin must be fully reformed, meaning a strenger dork colour (such as SOOnn ligni), will be easier to detect as rhodopsin is very receptive to darher colours. As shown on the graph the rooks are very receptive to 500 nm of zigh wavelength, whereas Cones, which are much more receptive to bright coloured light is ce most receptive to high wavelength light eige 620mm.

Analyse the graphs to explain the results of this investigation.

(6)

The shortest time spen is datures gave for both wavelight innung light intersity as which LED was seen. gredged M This is due to less time being available for shadopsin recynthesise from opein + sectional and convert trans-retine back to cis-setinal jollowing exposure to light. Rhodopsin is use able to dueck the light CRD. its active form. There is a similar trend for low time in darliness for both 620nm and 500nm light due to rhodopsin having low sensitivity to all light. darhness increases, shadopsin has been able to As time in resynthesise, increasing its sensitivity, allowing a or lower minimum light intensity to jird be detected SOOnm centifies to show this trend as this wavelugt IS the aptionum you rad Cills relative sersitivity compared This high wavelength plateers with ruisimum to 620 nm. light intelsity due to day shadopsin having low sersitivity the bottom graph. The mininum light Seen a low volve due intersity 1-1 550 500 m light reacher cells having high sensitivity through retinal Many rod Cells can direct the 500 nm light at Convergence intersities, joining to one bipda newone which small enough combined stimuli to queate an action petertial, allowing light detection (Total for Question 5 = 10 marks)

This is an excellent answer. The data is discussed and related to the explanation. The different sensitivity of rod and cone cells and the resynthesis of rhodopsin are discussed and related to the data. Six marks were awarded.

Analyse the graphs to explain the results of this investigation.

After Exportance to bright light chodowin i bleached to the od cleve cannot for deterd light until modernin 4 reformed. However when soon high is used, it take long Some the for evenladly the light can be detected at much lower interdity than the 620 nm light This is because eventually the modopin reform and Soan is the havelength those rold cerrs are nort Ferritine to so they concluded a the The minesonen light intersty that 620 am con begeen at is an higher than for 500 am. 620 amin the brandlength that carbo pricked up by red conce but not gods. On Comer are UM Sentitive to light because only one cone is attached to care bipolar less. However, many rod cerry are connected to one hipple cerry to Cerreral Lub Greehold generator rotatiale concold up to one threphold potential in the Lipolar and remove by furnation to rod cense are nor Cereiting & light This in extragation may not

(6)

Although all the lines are not completed, this is an excellent answer that gained six marks. Summation and rhodopsin synthesis are explained and the explanations are linked to the data. This illustrates the concept that precise, accurate answers will often gain credit.

Do not think that you always have to fill all the space. A shorter answer that is precise, accurate and answers the question will gain credit.

Analyse the graphs to explain the results of this investigation.

100				
101				
	ð	μ.	۰.	

For the e 500 nm light, as the time spent in darkness after Movedses, the lesser the light intensity which LED was seen. 500 nm light falls within the wavelengths of mainly RODS, and intelle stasition of green cones and very title Red cones and blue cones.

For the 620 nm hight at first the when the time spent in darkness. Increased the minimum light intensity which LEP was seen was lesser however after a short time in darkness, the time spent in dancness did not affect the minimum light intensity at which LEP was seen. The 620 nm light falls within main by red conce and veny little sensitivity with roas and areen cones.

For the 500 nm light, the reason why with increased time the less light infinity is needed for led tobe seen is because since it falls mainly within rods and oreen cones, tots for rod cells, the gen for a denerator potential threshold to be reached, many rod cells can synapse with one bipolar cell hence the longer time in the dark, more different light i range of light intensities on beseen hence itsseringht is needed.

while for the 670 nm light, increased time & barely affects and does not affect the the minimum light intensity preded to see the LEP is because the ight falls mainty is highly sensitive found the cones vather than the rods hence since one cone sunapses with one bipola the cones vather than the rods hence since one cone sunapses with one bipola cell, the stimulus which is the light intensity, needs to be bright enovan for the cones to amenator and action potential to a cour generator potential to a cour

This is a very good answer that gained four marks. The data is discussed and the effect of summation explained but there is no real mention of the resynthesis of rhodopsin so the highest level that could be awarded was level 2. Analyse the graphs to explain the results of this investigation.

(6) - The independent variable was the type tight type of light ubrelengt + time in darkness - control valiable = time in tota dannerss ower wavelength light (SOOnn) was Lower light intensity LEDC620M ighor WL relengths or ligh ± (620nm) ones reds, green conos + Red cones are all sensitive to light so H the valuate Br was able to see LED at a higher lig! Question 6 (b)(i)

Many candidates found this question challenging. Few referred to oncotic pressure or explained that the oncotic pressure of the plasma is due to plasma proteins that are unable to leave the capillary. Oncotic pressure is the term listed in the specification and so candidates should refer to it. Many candidates did, however, correctly explain that tissue fluid enters due to the net effect of the oncotic and hydrostatic pressures. Many candidates also referred to the movement of water rather than tissue fluid.

(b) Oedema is an accumulation of tissue fluid. This is due to less tissue fluid being returned to the blood capillaries.

Explain how tissue fluid is returned to capillaries. (3) -> Alter fissue fluich leaves is forced art & mearteride end & the capelaries due to the high hydrostatic pressure loy and engenocytes he rentricles, -) Albunins and (pleasure proteins) benais in the capillaces, -) - Oncobe pressure stays constant while hydrostable pressure drops below it area & , water mones from an high water potential avoide are capilary to an area & low water poterbal inside, _ so clinice is reproved at the sourcemans real.

This is a good answer that gained two marks. The candidate correctly explains how the difference between hydrostatic and oncotic pressure causes tissue fluid to enter and states that there are more plasma proteins in the plasma compared with the tissue fluid.

- (b) Oedema is an accumulation of tissue fluid. This is due to less tissue fluid being returned to the blood capillaries.
 - (i) Explain how tissue fluid is returned to capillaries.

(3) the Tissue Fluid is returned Cappilaries the lymph VIa

This is an example of an answer that gained no credit. The candidate has misread the question and refers to the movement of tissue fluid into the lymphatic system rather than the capillaries. The candidate may have read the first few words of the question: 'Explain how tissue fluid is returned' and then immediately started their answer.

Make sure that you read all the words in each question.

- (b) Oedema is an accumulation of tissue fluid. This is due to less tissue fluid being returned to the blood capillaries.
 - (i) Explain how tissue fluid is returned to capillaries.

prie to high hydrostatic pressure at the ateni
As the blood vanees increase in distance from the heart
, hydrostatic pressure drops at ne venuous end of the
capillany bed oncotte pressure nonsurer in is higher
however so me tissue puid containing nutrients and theme gans
like con so note diffuses back into capillaries.

(3)

This is an example of a common answer for this question. The candidate correctly explains how the combined effects of oncotic and hydrostatic pressures cause the return of tissue fluid but gives no further detail.

Question 6 (b)(ii)

This question generated answers with a wide spread of quality. Strong answers used detailed, accurate terminology, referring to reduce pumping of sodium ions out of the ascending limb, reduced removal of water by osmosis from the descending limb due to the higher water potential of the medullary fluid and reduced removal of water from the collecting duct. Weaker answers often did not refer to the ascending and descending limbs giving vague statements such as lower water uptake or less salt movement. Candidates also need to be careful when describing water potentials – many referred to lower salt concentration lowering the water potential.

(ii) Furosemides are drugs that are used to reduce oedema. They are diuretics that increase urine production.

Furosemides reduce the active transport of sodium ions by the loop of Henle.

Explain how furosemides cause an increase in urine production.

(4)hissue mo low as 5 X colle is Lost via all han

This answer gained one mark. There is a lot of information given about sodium ion movement but key details are missing. One mark was awarded for the increased water potential of the medullary fluid.

(ii) Furosemides are drugs that are used to reduce oedema. They are diuretics that increase urine production.

Furosemides reduce the active transport of sodium ions by the loop of Henle.

(4)

Explain how furosemides cause an increase in urine production.

IF that is less allie trasport of adam ions Ewhich would occur at asceday loop of have the ions ontside or 61 1055 viuognosis less hater would leap dexendr). and more igns wand be in 60th the loop is there is not of the the Gop 3 19m the word hea that more would be Prehed there is more contact in the loop an to be passed onto the writing trad.

Question 7 (a)(i)

Many candidates were able to give a definition of a dominant allele although a significant number found the question very challenging. Strong answers stated that dominant alleles will affect the phenotype or area expressed when only one copy is present. Many candidates gave imprecise definitions such as, 'alleles that overpower other alleles' or 'alleles which affect a phenotype.' Candidates should make sure that they know formal definitions for genetics terms.

- (a) The scientists concluded that feather colour in owls is controlled by a single genetic locus. The brown allele is dominant to the grey allele.
 - (i) State what is meant by a dominant allele.

- (a) The scientists concluded that feather colour in owls is controlled by a single genetic locus. The brown allele is dominant to the grey allele.
 - (i) State what is meant by a dominant allele.

(1)Dominant alleles are the phenotype to be displayed on the individual and is

(1)

- (a) The scientists concluded that feather colour in owls is controlled by a single genetic locus. The brown allele is dominant to the grey allele.
 - (i) State what is meant by a dominant allele.

An alleve always expressed recessive allere is in phen a Examiner Com This answer gained one mark. The candidate makes it clear that only

(1)

one copy of the allele is needed to affect the phenotype.

Question 7 (a)(ii)

Many candidates found this question challenging. Candidates were asked to explain the range of phenotypes of feather colour after being told that feather colour is not a polygenic trait. Few answers recognised that the two peaks represented a peak for owls with two grey alleles and peak for owls with two brown alleles or a grey and a brown allele. Few also recognised that the variation around the peaks would be due to environmental factors or subjective scoring of the colours. A few more candidates recognised that the higher peak for grey owls may have suggested some form of natural selection. Many candidates suggested that disruptive selection would have occurred. Many other candidates also simply gave descriptions rather than giving an explanation.

(ii) Explain the range of feather colours, shown in the graph, in this population of owls.

On owns with a colour score of 2 had the highest percentageon of all an owns. They are the most gray owns.

(2)

(ii) Explain the range of feather colours, shown in the graph, in this population of owls.

The wide range of reather colour shows genetic divenity & within tainly outs. Grey ours with a colour score of 2 were had the highest penentage, suggesting the allele for these grey reathers is advantageous and passed on to the next generations by notural releation.

(2)

(2)

(ii) Explain the range of feather colours, shown in the graph, in this population of owls.

-30% of outs where green them to advantageous allele that allano artic the areas clace ors percaltage or are la

Question 7 (a)(iii)

This question generated a very mixed range of answers. Many candidates are now well versed in completing Hardy-Weinberg calculations, but some candidates found the calculation very challenging. Some candidates were unable to calculate the frequency of the recessive, grey, allele (q). Determining 'q' should always be the first step of a Hardy-Weinberg calculation. Some candidates were able to correctly calculate q and p but were then unable to determine the proportion of heterozygotes.

(iii) In this population of 120 oxis (84) of them were grey. Calculate the number of owls that are heterozygous for feather colour. Use the Hardy-Weinberg equation $p^{2} + (2pq) + q^{2} = 1$ (3) $q^{2} = \sqrt{\frac{344}{120}}$ $q^{2} = \sqrt{\frac{344}{120}}$ $q^{2} = \sqrt{\frac{344}{120}}$ $q^{2} = \sqrt{\frac{3}{120}}$ $q^{2} = \sqrt{\frac{3}{120}}$

(iii) In this population of 120 owls, 84 of them were grey.

Calculate the number of owls that are heterozygous for feather colour.

Use the Hardy-Weinberg equation $p_{p}^{nown} = p_{p}^{nown} p^{2} + 2pq + q^{2} = 1$ (3) $q^{2} = \frac{84}{120} = 0.7$ q = 0.84 q = 0.84 q = 0.84 q = 0.84q = 0.84

$$2pq = 2 \times (0.84 \times 0.16)$$

= 2 × 0.1344
= 0.2688

Answer 32

(iii) In this population of 120 owls, 84 of them were grey.

Calculate the number of owls that are neterozygous for feather colour. Use the Hardy-Weinberg equation 2/9 $g(4/10 = 0.7 = 0.04) + q^2 = 1$ (3) $g(4/10 = 0.7 = 0.04) + q^2 = 1$ (3) g(5) = 0.5 = necessine (brown) = 9. g(5) = 0.58 = 0.49 g(7) = 0.58 = 0.42. g(7) = 0.58 = 0.42.

Answer 0.42.

Question 7 (b)

This question presented candidates with data on brown and grey owl populations along with the depths of snow over time. Candidates were asked to evaluate whether the data showed that human activity was causing a change in allele frequency of the owls. Strong answers discussed all aspects of the data, gave explanations for how human activity would have an effect and also gave reasons why the conclusion was not correct. As the question asked candidates to evaluate the evidence, both sides of the argument had to be considered to reach level 3. Most candidates were able to describe the data patterns and give some explanation for them to gain three or four marks. Only the strongest candidates explained why the data may not support the conclusion and went on to score five or six marks. When asked to evaluate, candidates should always give both sides of an argument.

Analyse the data to evaluate this conclusion.

(6) The near snow depth decreases between 1980 and 2007, sturking at around 11 and ending around 2001. Since brown ouls are more likely to survive in lower show depths than higher ones, as the will skindowt more lopredators if there is more snow soit acts as a selection pressure against them, the percentage of outs brown owls surviving has likely increased over time as the onowdepth has decreased. This is backed up by the increase in percentage of brownowls. Is the show depth decreases, the grey owlswill become selected against as they will become more noticable than the brown owld to predators so they their population gets smaller and the grey alleles a see and homogenous recesive genotype is selected against. This would increase the frequency of the brown alleles as they become selected for which is shown in the increase in the percentage of brown owls in these years going hom around 12% to ground 45% However noduta is provided linking a decrease in snow depth to chimate change and although it is "likely there could be another Fucher decreasing the (Total for Question 7 = 12 marks) show depth or a different selection pressure selecting hr the brown heathers so the scientists cannot be sure.

This is an excellent answer that was awarded five marks. The candidate discusses the data, gives explanations for the changes in owl populations and gives a reason why the data may not be supportive.

If the command word is 'evaluate' always give both sides of an argument.

Analyse the data to evaluate this conclusion.

(6)

Analyse the data to evaluate this conclusion.

. The population of the brown owls is increasing as a result of climate change -. As the brown owls have a higher chance of survival in fewer snow depth, as a result of global warming the snow depth is decreasing. The population percentage of Brown owls increase, they are almost SO? percent of the owl population

(6)

Analyse the data to evaluate this conclusion.

(6) while this is the it is due to Directional arey tawn . Where vive + thrive better N SUR OW ow depth as o D higher brown owls. This 0 m 170 to being able pett Call D 6 environment DNU ONIS. brow zatory, than o rate por ar OT emitter has JUSEC libico ocr se dent SOOW LI enth hi CC 01 Ing NTU bur Leol reloasing UD reloase mont NINTON nto $\left[\left[0 \right] \right]$ Pr hovelongt 10 trap m luces show sun, this heat molting inina This loads to a higher number ((Total for Question 7 = 12 marks) com pareolto Drown OWIS hunted easier. This are tey rival rate means the dominant higher allele is more frequent as it is possed down TOWN

This is a good quality answer that discusses the data and gives explanations. There is, however, no counter argument so is a level two answer gaining four marks.

Question 8 (b)

This question asked candidates to look at the changes in soil depth, mass of nitrate and mass of leaf litter of areas of ground exposed after a glacier has melted. Candidates were asked to explain the changes shown in the table. Many candidates gained at least one mark with many gaining three marks. Most candidates understood that primary succession had occurred. Many stated that pioneer species had arrived, microbial decomposition had increased the mass nitrates in the soil and more niches/soil depth was available for more plants to grow. Few candidates directly related the theory to the data in the table and did not identify the jump in nitrate content after 100 years or the decrease in leaf littering after 150 years. Candidates should always try to organise their answers around the data.

(b) Explain how succession brings about the changes in the soil during this period of time.

pioneer species, such as Ichen, colonise area. Lichen groun on bore rock that is left after melting. pioneer species like lichen the are highly adapted to withstand hash environmental analihons eventually pioneer species breate down rock and they die talecomposed by micropognisms. Produces humus = orgonic material, in soil. Allows for more complet orginisms to grow and they outcompete lichen as they have more ecological niche's. These then a clecompose and process repears. As more planks forgonisms allocompose more for note and added to the soil which means larger more complet againsms can grow = 7 more nitrates = 7 more anishs awas produced... more planks so grower and have a lear litter. Climate community created.

(5)

This answer gained three marks. Succession is explained correctly but there is no reference to timings or the subtle changes that occur.

(b) Explain how succession brings about the changes in the soil during this period of time.

(5) Pioneer Colonister Species arrive when abiotic factors and there isn't much nitates \$ are harsh Sori and occupy nutrents in a Sto Nighly riche. Pionever species break dawn specialised roots to form more soil and then rocks with die nitrates & nutrients \$ decompose by returning into the soil abiatic factors Decome harsh. Coloniser species arrive & OTH 1285 out compete Dioneer Species, coloniser more larger plants usually Species pioneer Species die Miches SO Coloniser to dies & oseg, forms)elies decomp also more soi returns nitrates & nutrients 8 NO Species OR amile becomes more fertile, eventually, community is dimax

This answer also explains succession well but does not give any time frames or identify the more subtle features of the data.

Question 8 (c)(i)

This question presented candidates with the oxygen dissociation curve for leghaemoglobin and haemoglobin and asked candidates to explain how it shows that the structure of leghaemoglobin is more similar to myoglobin than haemoglobin. Many candidates incorrectly suggested that both myoglobin and leghaemoglobin has very high affinities for oxygen and that both are shifted to the right of haemoglobin. Strong answers that gained two or three marks explained leghaemoglobin does not have a sigmoidal curve and so no cooperative binding occurs. (c) The roots of some of the plants growing around the glacier were found to contain an oxygen binding protein called leghaemoglobin.

The graph shows the oxygen dissociation curve for leghaemoglobin and the oxygen dissociation for haemoglobin.

(i) Leghaemoglobin is a protein that is similar in structure to myoglobin. Both of these proteins have one subunit.

Explain how the oxygen dissociation curve shows that the structure of leghaemoglobin is more similar to myoglobin than to haemoglobin.

(3)

The leghaemoglobin graph isn't sigmoidal # like the haemoglobin curve, it is linear before levelling off after a 14kpg partial pressure of oxygen. Oxygen dissociation curve for haemoglobin is s-shaped as it has 4 subunits for oxygen to bind to and each subunit has a different exygen affinity. Leghaemoglobin is how lenear up to 14kPa pploz) as there is only one subunit for oxygen to bind to.

(c) The roots of some of the plants growing around the glacier were found to contain an oxygen binding protein called leghaemoglobin.

The graph shows the oxygen dissociation curve for leghaemoglobin and the oxygen dissociation for haemoglobin.

(i) Leghaemoglobin is a protein that is similar in structure to myoglobin. Both of these proteins have one subunit.

Explain how the oxygen dissociation curve shows that the structure of leghaemoglobin is more similar to myoglobin than to haemoglobin.

扻

(3)

haemoglobin produces a curred graph arret o the conformational shape change that occurs changing the binding of oxygen to the other 3 subunits. whereas because regneamoglobinand myoglobin only have one subunit, there is no shape change ro each or more cure binas in the same way, producing a straight graph.

This excellent answer gained all three marks. The candidate has stated that leghaemoglobin does not have a sigmoidal curve and that this is because cooperative binding does not occur.

Question 8 (c)(ii)

Most candidates gained at least one mark on this question, usually for correctly stating that the oxygen levels in compacted, water-logged soil is low. A significant number of candidates did not go on to gain further credit as they gave no reference to respiration or functions of the ATP that has been produced. Strong answers gave uses for the ATP such as the active uptake of nitrate ions which can be used to mark amino acids. Many candidates focused on the gaining of oxygen without extending their answer to explain how gaining oxygen would increase growth.

(ii) Explain how leghaemoglobin enables these plants to grow in waterlogged and compact soils.

In waterlogged soils, water fills up the cur spaces which
means less oxygen is available in the soil. Since
leahaemoalobin has high affinity for oxygen, it acts
a store for oxygen and releases it when needed
a diale lace access available has a constant
su the plurit vius oxygeri available for respiracion

This answer gained two marks. The candidate explains that the waterlogged soil lacks oxygen and that the leghaemoglobin enables respiration to occur. There is no explanation of how respiration will increase growth.

(3)

(ii) Explain how leghaemoglobin enables these plants to grow in waterlogged and compact soils.

because regnerencegiosis doesn't have a high
oxygin saturation it is therefore easier to
be able work underground in waterlogged
and compart soil because one soil
wouldn't be able to have much
oxygen entering and exiting aut.

(3)

(ii) Explain how leghaemoglobin enables these plants to grow in waterlogged and compact soils.

here (3) On to

This excellent answer gained all three marks. The candidate clearly explains that waterlogged soil lacks oxygen and that the leghaemoglobin enables the plant to respire and release for nitrate uptake and protein synthesis.

Question 9 (a)(ii)

A significant number of candidates found this question challenging although many gained both marks. A few candidates drew α -glucose and others did not draw accurate ring structures. A minority of candidates also incorrectly drew water molecules.

(ii) Draw one of the products of the hydrolysis of this part of the cellulose molecule.

(2)

This answer gained no marks. The ring structure is not complete and the candidate has included water.

(ii) Draw one of the products of the hydrolysis of this part of the cellulose molecule.

This gained one mark. The OH group on carbon number one is correct but the candidate has made an error by adding an OH group to carbon number five.

Question 9 (a)(iii)

Most candidates were able to gain at least one mark on this question, but few went on to gain all three. Most were able to explain that cellulose is a straight chain molecule and is bonded to other cellulose molecules by hydrogen bonds. Few went on to explain how the structure of cellulose means that it strengthens cell walls so that cells do not burst when under pressure. Only a handful of candidates explained that the structure of cellulose means that it is permeable to water molecules. A small number of candidates suggested that cellulose has a branched or helical structure.

(iii) Explain how the structure of cellulose is adapted for its function in plant cell walls.

Cellulose is unbranched and forms B-1.4 glycosidirc bands in alternating pattern forming straight chans. These chang form hydrogen bands with each other to form strong microfibrils that plant cell as they re quite a lot of ener break

(3)

This answer gained two marks. The candidate explains that cellulose molecules are straight chains and are joined by hydrogen bonds.

(iii) Explain how the structure of cellulose is adapted for its function in plant cell walls.

opposite	- parallel	Strands	9e	collulose	Form
Hydrogen 6	onds betwee	n each	other	creating	cellulose
microfibril	s allow	ng For	high	tensile	strength.

chercy	ctore.	Also i	nsoluble	e due	to it
bing	non - polo	xr 🗪	So	:+*	Joesnt
effect	0>~4	itic po	stential	. •	

This answer gained just one mark for stating that hydrogen bonds hold molecules together.

(3)

(iii) Explain how the structure of cellulose is adapted for its function in plant cell walls.

· collulore moulos reacting conderparaire au to form straight chain cellulore neco no shought chains pronded aged smith so cell concultionand higor pressur · collutone isn of P guion do can form betwee uliteminoplas Mar n it many worallwall he micoplants, ulu navods colluton materias are

(3)

Question 9 (b)(i)

Around half of the candidates correctly answered this question. Some candidates gave confused answers that did not refer to the idea that an index of diversity takes into account the populations of each species as well as the number of different species.

(i) State why calculating an index of diversity is a better measure of biodiversity than counting the number of different species.

(1)takes into accound number of species and number of individuals in each species.

This answer correctly states that an index of diversity takes into account both populations and numbers of different species.

 State why calculating an index of diversity is a better measure of biodiversity than counting the number of different species.

(1)

adurate and effective

(i) State why calculating an index of diversity is a better measure of biodiversity than counting the number of different species.

(1) Because the index of diversity takes into account the minutes

This answer gained one mark. A correct reference to the index of diversity taking populations into account is given.

Question 9 (b)(ii)

This question assessed candidates' understanding of the benefits of in situ conservation compared with ex situ conservation. Most candidates were able to give at least one benefit although many simply gave a description of what in situ conservation is (animals remain in natural surroundings was often seen) rather than explaining the benefits. Common correct answers included behaviours not being affected, whole areas and food webs being conserved and reduced inbreeding. Some candidates still confuse inbreeding with interbreeding. A small number of candidates incorrectly stated that in situ conservation places organisms in zoos.

(ii) Give two advantages of in-situ conservation of elephants compared with ex-situ conservation of elephants.

Kemain in natural habitat 50 they being when trans more due cosystem no specialised area is required

(2)

(ii) Give two advantages of in-situ conservation of elephants compared with ex-situ conservation of elephants.

(2)

Breeding programmes can be set up with in-situ conservation of elephants
Able to track the trade of elephants or moving of elephants for breeding from one place to another using log b doks.

This answer gained no marks – the candidate has confused in situ conservation with ex situ conservation.

(ii) Give two advantages of in-situ conservation of elephants compared with ex-situ conservation of elephants.

(2)

- amons men to keep main natural

Enstincts as elephants constitt Kept in natural habited -> will not ais Mipt ecosystems-as elephants Kept à Meir natural habitet

This is a good answer that gained two marks. The candidate clearly explains that in situ conservation keeps the natural behaviours of animals and maintains the whole ecosystem.

Question 9 (b)(iii)

This question generated a good range of answers. Most candidates gained at least one mark, often for describing the effect of the paper project on biodiversity compared with banning people from conservation areas. Stronger answers explained that the project was successful as it gave local people an income from the elephants and so there was less destruction of habitats, and the local people had an incentive to protect the elephants from poaching. Many candidates also stated that by protecting the elephants, the elephants would transfer seeds of plants and create other niches so that overall biodiversity increased.

(iii) Explain the effect of the new paper project on biodiversity compared with the on mail of protected area where local people were banned.

hthen individually were banned it meant malt a zoo formiand and forcing way burnt to keep the eventianal and forcing way burnt to keep the event and and forcing way burnt to keep the event and and forcing way hat used halt forcing at a habitalt or organism. That relied on that area to find food. By animali olying mudaleard the biodiversity - Neverer with the new project the index of diversity area by 0.8, snawing hat the biodiversity new project the biodiversity has increased with the new project the biodiversity area by 0.8, snawing hat the biodiversity has increased with the paper project, this may be due to local being encouloged to locy after the elephantic and iand around instead of relations, my means have no habitalt were being definated so animals and some to the force of the

This is a very good answer that gained three marks. The candidate explains that the biodiversity is higher in the area with the paper project and then goes on to explain that this is due to the local people gaining a benefit and so maintaining the habitat.

(iii) Explain the effect of the new paper project on biodiversity compared with the protected area where local people were banned.

(4)

The new paper project after two years had an increase in
prodiversity as it meant that not only where the elephants
being maintained and gaurard. It-also meant that there
could continue to grow in that and as they make no longer
being aundown to be toler por papar be the akkak thank
terninged by formers and whill't also protecting the ana
people where banned from allowing biodiversity to spread naturally.
On the contrary, the conservation and puople where bounded from
had a devorace in broding neg as they would burn or damage
certain areas to prevent eliphanti from eating or dy hoying them.
This could have that led to the loss of some species so his diversity
were down.

This answer gained two marks for describing the higher biodiversity in paper project area and explaining that there is less destruction of habitats. (iii) Explain the effect of the new paper project on biodiversity compared with the protected area where local people were banned.

The paper project as so has economic benefits, providing nore incentul to get invoised.

This answer gained three marks. The candidate has described the increased biodiversity and has gone on to explain that in the area where people are banned, poaching has continued and that the elephants now have value to the local people.

(iii) Explain the effect of the new paper project on biodiversity compared with the protected area where local people were banned.

(4)

There was an increase in the index of diversity in the
area with paper projected, as because formers were not
burning the areas so biodiversity was able to thrive as
habitats were not being destroyed. The fact that formers
were able to make money from the dung persuaded them
not to burn the areas.
There was a decrease in index of diversity in the area
locais were banned from an because farmers were
still burning areas as there was no indicate not to.
Their crops were probably still being eaten/trampled but
there was no plus side to having the elephants around.

This excellent answer gained all four marks. The candidate describes the increase in biodiversity and goes on to explain how making the elephants valuable to the local people has reduced habitat loss and prevented burning of the areas.

Question 9 (c)

Many candidates were able to gain one mark to explain the limitations of CITES but few went on to gain both. Some candidates simply stated the roles of CITES or stated that roles of conservation in general – candidates should read questions carefully to ascertain what the questions are looking for. Good answers discussed the non-voluntary nature of the treaty, the problem that many species have ranges that overlap over borders and the issues with preventing illegal activity.

(c) Describe the limitations of CITES in the conservation of organisms such as elephants.

- Not all combries have signed up to be part of the
Conserversion breaty,
- hunting and trading elephents are still legal in some
countries where they are lourd and the northets are in
high demarel.

(c) Describe the limitations of CITES in the conservation of organisms such as elephants.

(2)

(2)

Not all countries have joined CITES and it someone goes against siTES,

it isn't illegal.

(c) Describe the limitations of TTBS in the conservation of organisms such as elephants.

(2) ad nunting of Preventing people from tradingelephonto and is difficult because ney are large ad cuitable for poorer Ering income Preventing Re formi s ma of elephant will lead to people 1 becoming poorer ad unable to provide for inscher

This answer gained one mark for the idea that it is difficult to prevent people from trading species when the rewards are high.

Paper Summary

Based on the performance of this paper, candidates are offered the following advice:

- having a clear understanding of what each command word requires these are listed in the specification
- showing all working for calculations
- using key scientific vocabulary accurately
- applying their knowledge confidently to unfamiliar contexts
- making sure that you consider mark allocations for each question before writing answers.

Grade boundaries

Grade boundaries for this, and all other papers, can be found on the website on this link:
