Additional Materials: Data Booklet

Candidates answer on the Question Paper.

### **READ THESE INSTRUCTIONS FIRST**

Write your Centre number, candidate number and name on all the work you hand in. Write in dark blue or black pen.

You may use a soft pencil for any diagrams, graphs or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

#### **Section A**

Answer all questions.

### Section B

Answer all questions.

You may lose marks if you do not show your working or if you do not use appropriate units.

A Data Booklet is provided.

Electronic calculators may be used.

At the end of the examination, fasten all your work securely together. The number of marks is given in brackets [ ] at the end of each question or part question.

## **Section A**

For Examiner's Use

Answer all the questions in the spaces provided.

| I | (a) | Wh    | at is meant by the term standard electrode potential, SEP?                                                             |
|---|-----|-------|------------------------------------------------------------------------------------------------------------------------|
|   |     |       |                                                                                                                        |
|   |     |       | ro1                                                                                                                    |
|   |     |       | [2]                                                                                                                    |
|   | (b) |       | w a fully labelled diagram of the apparatus you could use to measure the SEP of the $^{+}/\mathrm{Fe^{2+}}$ electrode. |
|   |     |       |                                                                                                                        |
|   |     |       |                                                                                                                        |
|   |     |       |                                                                                                                        |
|   |     |       |                                                                                                                        |
|   |     |       |                                                                                                                        |
|   |     |       |                                                                                                                        |
|   |     |       | [5]                                                                                                                    |
|   | (c) | The   | reaction between Fe³+ ions and I⁻ ions is an equilibrium reaction.                                                     |
|   |     |       | $2Fe^{3+}(aq) + 2I^{-}(aq) \iff 2Fe^{2+}(aq) + I_{2}(aq)$                                                              |
|   |     | (i)   | Use the <i>Data Booklet</i> to calculate the $E_{cell}^{e}$ for this reaction.                                         |
|   |     |       |                                                                                                                        |
|   |     | (ii)  | Hence state, with a reason, whether there will be more products or more reactants at equilibrium.                      |
|   |     |       |                                                                                                                        |
|   |     |       |                                                                                                                        |
|   |     | (iii) | Write the expression for $K_{\!\scriptscriptstyle c}$ for this reaction, and state its units.                          |
|   |     |       | $\mathcal{K}_{c}=$                                                                                                     |
|   |     |       | · c                                                                                                                    |
|   |     |       | units                                                                                                                  |

An experiment was carried out using solutions of  $Fe^{3+}(aq)$  and  $I^{-}(aq)$  of equal concentrations.  $100\,cm^3$  of each solution were mixed together, and allowed to reach equilibrium.

The concentrations at equilibrium of Fe<sup>3+</sup>(aq) and I<sub>2</sub>(aq) were as follows.

$$[Fe^{3+}(aq)] = 2.0 \times 10^{-4} \,\text{mol dm}^{-3}$$
  
 $[I_2(aq)] = 1.0 \times 10^{-2} \,\text{mol dm}^{-3}$ 

| (iv) | Use these data, together with the equation given in (c), to calculate the concentrations |
|------|------------------------------------------------------------------------------------------|
|      | of Fe <sup>2+</sup> (aq) and I <sup>-</sup> (aq) at equilibrium.                         |

$$[Fe^{2+}(aq)] = \dots mol dm^{-3}$$

$$[I^{-}(aq)] = \dots mol dm^{-3}$$

(v) Calculate the  $K_{c}$  for this reaction.

[Total: 15]

**2** Ethyl ethanoate is hydrolysed slowly by water in the following acid-catalysed reaction.

For Examiner's Use

$$\mathsf{CH_3CO_2CH_2CH_3} \ + \ \mathsf{H_2O} \ \stackrel{\mathsf{H^+}}{-\!\!\!\!-\!\!\!\!-\!\!\!\!-\!\!\!\!-} \ \mathsf{CH_3CO_2H} \ + \ \mathsf{CH_3CH_2OH}$$

The concentration of ethyl ethanoate was determined at regular time intervals as the reaction progressed.

Two separate experiments were carried out, with different HCl concentrations.

The following graph shows the results of an experiment using  $[HCl] = 0.1 \text{ mol dm}^{-3}$ .

(a) When the experiment was carried out using  $[HCl] = 0.2 \,\text{mol dm}^{-3}$ , the following results were obtained.

| time/min | [CH <sub>3</sub> CO <sub>2</sub> CH <sub>2</sub> CH <sub>3</sub> ]<br>/mol dm <sup>-3</sup> |  |  |
|----------|---------------------------------------------------------------------------------------------|--|--|
| 0        | 0.200                                                                                       |  |  |
| 10       | 0.160                                                                                       |  |  |
| 25       | 0.115                                                                                       |  |  |
| 50       | 0.067                                                                                       |  |  |
| 75       | 0.038                                                                                       |  |  |
| 100      | 0.022                                                                                       |  |  |
| 125      | 0.013                                                                                       |  |  |

(i) Plot these data on the axes above, and draw a line of best fit.

For

| (11)    | Use one of the graphs to show that the reaction is first order with respect to $CH_3CO_2CH_2CH_3$ .                            | Examiner's<br>Use |
|---------|--------------------------------------------------------------------------------------------------------------------------------|-------------------|
|         | Show all your working, and show clearly any construction lines you draw on the graphs.                                         |                   |
|         |                                                                                                                                |                   |
|         |                                                                                                                                |                   |
| (iii)   | Use the graphs to calculate the order of reaction with respect to HC1.                                                         |                   |
|         | Show all your working, and show clearly any construction lines you draw on the graphs.                                         |                   |
|         |                                                                                                                                |                   |
|         |                                                                                                                                |                   |
| (iv)    | Write the rate equation for this reaction, and calculate the value of the rate constant.                                       |                   |
|         | rate =                                                                                                                         |                   |
|         |                                                                                                                                |                   |
|         | [7]                                                                                                                            |                   |
| (b) (i) | Why is it <b>not</b> possible to determine the order of reaction with respect to water in this experiment?                     |                   |
|         |                                                                                                                                |                   |
| (ii)    | Although [CH $_3$ CO $_2$ CH $_2$ CH $_3$ ] decreases during each experiment, [HC $l$ ] remains the same as its initial value. |                   |
|         | Why is this?                                                                                                                   |                   |
|         |                                                                                                                                |                   |
|         | [2]                                                                                                                            |                   |
|         | [Total: 9]                                                                                                                     |                   |

| 3 | (a) | (י) | What is meant by the density of a substance: |
|---|-----|-----|----------------------------------------------|
|   |     |     |                                              |
|   |     |     |                                              |
|   |     |     |                                              |

| Use data from the <i>Data Booklet</i> to explain why the density of iron is greater than that of calcium. |
|-----------------------------------------------------------------------------------------------------------|
|                                                                                                           |
|                                                                                                           |
| [8]                                                                                                       |

**(b)** In general, reactions of the compounds of transition elements can be classified under one or more of the following headings.

acid-base ligand exchange precipitation redox

(ii)

Choose the most suitable heading to describe each of the following reactions, by placing a tick  $(\checkmark)$  in the appropriate column in the table below.

Only one tick should be placed against each reaction.

| reaction                                                                  | acid-base | ligand<br>exchange | precipitation | redox |
|---------------------------------------------------------------------------|-----------|--------------------|---------------|-------|
| $[Cu(H_2O)_6]^{2+} + 4NH_3 \rightarrow [Cu(NH_3)_4]^{2+} + 6H_2O$         |           |                    |               |       |
| $[Cu(H_2O)_6]^{2+} + 4HCl \rightarrow [CuCl_4]^{2-} + 4H^+ + 6H_2O$       |           |                    |               |       |
| $2 \text{FeC} l_2 + \text{C} l_2 \rightarrow 2 \text{FeC} l_3$            |           |                    |               |       |
| $[Fe(H_2O)_6]^{2+} + 2OH^- \rightarrow Fe(OH)_2 + 6H_2O$                  |           |                    |               |       |

| $[Cr(OH)_4]^- + 1\frac{1}{2}H_2O_2 + OH^- \rightarrow CrO_4^{2-} + 4H_2O$ |           |                    |               |       |

[8]

**(c)** Alloys of aluminium, titanium and vanadium are used in aerospace and marine equipment, and in medicine.

For Examiner's Use

When a powdered sample of one such alloy is heated with an excess of aqueous NaOH, only the aluminium reacts, according to the following equation.

$$2Al(s) + 2OH^{-}(aq) + 6H_{2}O(l) \rightarrow 2[Al(OH)_{4}]^{-}(aq) + 3H_{2}(g)$$

Reacting 100 g of alloy in this way produced 8.0 dm<sup>3</sup> of hydrogen, measured under room conditions.

Calculate the percentage by mass of aluminium in the alloy.

percentage = ..... % [3]

[Total: 14]

8 In recent years there has been a lot of interest in polymers in the form of gels that absorb aqueous materials. One of the largest uses of these polymers is in disposable nappies (diapers). The gel which is used in this case is a polymer of propenoic acid.
