**TIME** 1 hour 30 minutes

**INSTRUCTIONS TO CANDIDATES**

- Write your name in the space above.
- Write your Centre number and Candidate number in the boxes above.
- Answer **all** the questions.
- Write your answers in the spaces provided on the question paper.
- Read instructions and questions carefully.

**INFORMATION FOR CANDIDATES**

- In this part of the Practical Test, you will be assessed on the Experimental and Investigative Skills:
  - Skill I Implementing
  - Skill A Analysing evidence and drawing conclusions
  - Skill E Evaluating evidence and procedures
- You may use an electronic calculator.
- You are advised to show all the steps in any calculations.
- You will be awarded marks for the quality of written communication where this is indicated.

<b>FOR EXAMINER'S USE</b>		
Qu.	Max.	Mark
Planning	16	
Implementing & Analysing	30	
Evaluating	14	
<b>TOTAL</b>	<b>60</b>	

---

**This question paper consists of 10 printed pages and 2 blank pages.**

Answer **all** the parts.

### Introduction

In this examination, you will determine the enthalpy change of decomposition of aqueous hydrogen peroxide.

In **Part 1**, you will carry out a titration using aqueous potassium manganate(VII) to determine the concentration of an aqueous solution of hydrogen peroxide.

In **Part 2**, you will calculate the concentration of the aqueous hydrogen peroxide from the readings obtained in the titration.

In **Part 3**, you will measure the temperature rise when aqueous hydrogen peroxide decomposes giving water and oxygen.

In **Part 4**, you will calculate the enthalpy change of decomposition of aqueous hydrogen peroxide.

Four chemicals are provided.

- Solution **H** is aqueous hydrogen peroxide,  $\text{H}_2\text{O}_2$ . Irritant 
- Solution **J** is aqueous sulphuric acid. Irritant 
- Solution **K** is aqueous potassium manganate(VII), of concentration  $0.0250 \text{ mol dm}^{-3}$ .
- Solid **L** is powdered manganese(IV) oxide. Harmful 

### Part 1 Titration with $\text{KMnO}_4$ Skill I (Implementing)

[10 marks]

**Record all of your readings in the space on page 3.**

Use a  $10.0 \text{ cm}^3$  pipette and filler to measure out  $10.0 \text{ cm}^3$  of aqueous hydrogen peroxide, **H**.

Empty the pipette into the volumetric flask.

Add distilled (or deionised) water to make up the solution to exactly  $250 \text{ cm}^3$ .

Mix the solution thoroughly before use.

Using a  $25.0 \text{ cm}^3$  pipette and filler, transfer  $25.0 \text{ cm}^3$  of this **diluted** solution into a conical flask.

Using a measuring cylinder, add  $20 \text{ cm}^3$  of dilute sulphuric acid, **J**.

Fill the burette with aqueous potassium manganate(VII), **K**.

Record all burette readings to  $0.05 \text{ cm}^3$  in a table on page 3.

Carry out a trial titration.

The colour change at the end-point is from colourless to light pink.

Repeat the titration procedure to obtain **two** accurate titres.

In each case, remember to add  $20 \text{ cm}^3$  of **J** to the diluted hydrogen peroxide solution before titrating.

*You will not have time to carry out more than two accurate titrations.*

Write your readings in the space below.

Calculate the mean titre.

Show which readings you used to calculate the mean titre by placing a tick under the readings used.

**Part 2 Calculating the concentration of H<sub>2</sub>O<sub>2</sub> in solution H**  
**Skill A (Analysis)**

[7 marks]

**In all questions, show your working and express your answer to 3 significant figures.**

- (a) Calculate the amount, in moles, of KMnO<sub>4</sub> used in the mean titre.  
The concentration of solution **K**, KMnO<sub>4</sub>, is 0.0250 mol dm<sup>-3</sup>.

answer = ..... mol

- (b) The ionic half-equation for the reaction of H<sub>2</sub>O<sub>2</sub> is

During the titration, the manganate(VII) ion, MnO<sub>4</sub><sup>-</sup>, is reduced to Mn<sup>2+</sup> in acidic conditions.

Give the ionic half-equation for this reaction.

Hence show that, in the titration, 1 mol of MnO<sub>4</sub><sup>-</sup> ion reacts with 2.5 mol of H<sub>2</sub>O<sub>2</sub>.

- (c) Calculate the amount, in moles, of H<sub>2</sub>O<sub>2</sub> in 25.0 cm<sup>3</sup> of the **diluted** solution used in the titration.

answer = ..... mol

- (d) Calculate the concentration, in mol dm<sup>-3</sup>, of H<sub>2</sub>O<sub>2</sub> in the undiluted solution **H**.

answer = ..... mol dm<sup>-3</sup>

**Part 3 Measuring the temperature change during decomposition of aqueous hydrogen peroxide, H.**  
**Skill I (Implementing) [5 marks]**

**Record all your readings in a table in the space below.**

Using a measuring cylinder, transfer 25.0 cm<sup>3</sup> of aqueous hydrogen peroxide, **H**, into the plastic cup in the beaker.

Measure and record its temperature to 0.5 °C.

You may need to tilt the cup so that the thermometer bulb is completely immersed.

***The reaction that follows is vigorous.***

***Avoid inhaling any spray that may be produced.***

Place the plastic cup and the beaker on the heat-proof mat provided.

Add the manganese(IV) oxide, **L**, to the hydrogen peroxide, **H**.

Stir the mixture with the thermometer until the maximum temperature is reached.

Record the maximum temperature to 0.5 °C.

Calculate the temperature rise.

**Readings**

**Part 4 Calculating the enthalpy change of decomposition of hydrogen peroxide**  
**Skill A (Analysing) [8 marks]**

- (a) State and explain briefly the role manganese(IV) oxide plays during the decomposition of hydrogen peroxide.

.....  
 .....  
 .....

- (b) Calculate the heat evolved, in Joules, when 25.0 cm<sup>3</sup> of aqueous hydrogen peroxide, **H**, decomposes, given
- mass of water present in 25.0 cm<sup>3</sup> of aqueous hydrogen peroxide = 25.0 g;
  - specific heat capacity of an aqueous solution = 4.2 J g<sup>-1</sup> K<sup>-1</sup>.

answer = ..... J

- (c) Use your answer from **Part 2(d)** to calculate the amount, in moles, of H<sub>2</sub>O<sub>2</sub> decomposed in the plastic cup in **Part 3**.  
 Hence calculate the enthalpy change for the decomposition of H<sub>2</sub>O<sub>2</sub>.

*If you were unable to calculate the concentration of H<sub>2</sub>O<sub>2</sub> in solution **H** in **Part 2**, assume that it was 1.73 mol dm<sup>-3</sup> so that you can attempt this part of the calculation.*

answer = ..... kJ mol<sup>-1</sup>

**(d) Safety**

Do you think that wearing protective gloves during this experiment would be desirable?

Justify your answer.

.....  
 .....  
 .....

Part 5 Skill E Evaluating

[14 marks]

*Part (d) carries about one third of the marks for Part 5.*

(a) State and explain **two** ways in which heat is lost during the experiment in **Part 3**. In each case, suggest how the apparatus could be improved to minimise the heat loss.

.....

.....

.....

.....

.....

.....

(b) During **Part 3**, a student accidentally measured out and used 50 cm<sup>3</sup>, instead of 25 cm<sup>3</sup>, of aqueous hydrogen peroxide, **H**. State and explain why this error would **not** alter the **temperature rise** she measured.

.....

.....

.....

.....

- (c) The concentration of  $\text{H}_2\text{O}_2$  in solution **H** can also be determined by adding manganese(IV) oxide and measuring the volume of gas produced. In a preliminary experiment, a student found that  $1.0\text{ cm}^3$  of solution **H** produced about  $18\text{ cm}^3$  of oxygen when decomposed. He then attempted to carry out one accurate experiment. A diagram of the apparatus showing his experiment in progress is shown below. He measured the final volume of gas when the reaction eventually stopped.

Suggest **two** improvements to this procedure that would significantly improve its accuracy. Justify both improvements that you suggest.

.....

.....

.....

.....

.....

.....

- (d) Which experiment for determination of the concentration of  $H_2O_2$  in solution **H** would be more accurate and more reliable, the method in (c) above or the titration you carried out in **Part 1**? Justify your answers.
