

Mark Scheme (Standardisation) Summer 2008

GCE

GCE Economics (6353/01)

General Marking Guidance

- All candidates must receive the same treatment. Examiners must mark the first candidate in exactly the same way as they mark the last.
- Mark schemes should be applied positively. Candidates must be rewarded for what they have shown they can do rather than penalised for omissions.
- Examiners should mark according to the mark scheme not according to their perception of where the grade boundaries may lie.
- There is no ceiling on achievement. All marks on the mark scheme should be used appropriately.
- All the marks on the mark scheme are designed to be awarded. Examiners should always award full marks if deserved, i.e. if the answer matches the mark scheme. Examiners should also be prepared to award zero marks if the candidate's response is not worthy of credit according to the mark scheme.
- Where some judgement is required, mark schemes will provide the principles by which marks will be awarded and exemplification may be limited.
- When examiners are in doubt regarding the application of the mark scheme to a candidate's response, the team leader must be consulted.
- Crossed out work should be marked UNLESS the candidate has replaced it with an alternative response.

Question	Answer	Mark
Number		
1(a)(i)	Output per unit of input per hour (2 marks)	
	Output per hour (1 mark)	
	Productivity definition, output per unit of input or sense of efficiency, productiveness (1 mark)	(2)
	Production or output in total (0 marks)	

Question Number	Answer	Mark
1(a)(ii)	Trend: Description of how the data changes over the period shown (1 mark). Allow 'productivity is falling in France'	
	Data comparison: If the data provided is given relative to Britain award (up to 2 marks, of which 1 may be for a valid calculation) e.g. French productivity is rising less quickly than British productivity.	
	Concept that 'Britain = 100' means it is the base or comparator, or that other figures are given as a percentage relative to Britain. (1 mark)	(0)
	Do not award marks for reference to Britain as having constant productivity	(3)

Question Number	Answer	Mark
1(b)(i)	Award three factors. At least one should be taken from the passage (the following factors): Lack of skills Full employment/inelastic aggregate supply Service-based economy Lack of space (retailing) Planning restrictions Transport problems Increasing size of government Underinvestment, particularly in research and development. Heavier taxes Regulation Also allow factors not in the passage, which might include: Labour market issues - e.g. strike action, national minimum wage Tax rates - corporation tax a disincentive to cut costs? Over spending by public sector e.g. crowding out issues For identifying 3 valid factors (2 marks) If two valid factors only (1 mark) Award up to (4 marks) for link to productivity (not	
	 Evaluation (2 marks, or 1 + 1). At least one point: Honda example of higher productivity in Swindon. Public sector productivity is hard to measure, and often low. Services in America have higher productivity. The gap is closing There may be more improvement in some countries than others Award prioritisation with justification. 	(8)

Question	Answer	Mark
Number 1(b)(ii)		
I (B)(II)	For each effect allow up to (2 marks)	
	Diagram up to (2 marks) showing rightward shift (or downward shift) in AS. For the first mark there should be a correct shift. For the second diagram mark the fall in price level and the increase in real GDP must be shown.	
	Effects via AS (1 mark identification, 1 mark explanation) might include:	
	 There has been a rise in real output 	
	 Changes in employment or unemployment 	
	 Increased wages 	
	Current account improves	
	 Britain becomes more competitive internationally (AS shift to right) 	
	 Inflation (cost push) slows or price level falls 	
	 Increase in investment or FDI 	
	 Standards of living increase 	
	Firms may become more profitable	
	Award no marks for reasons why productivity is low, or why it has improved.	
	For a convincing answer explaining that AD might shift to the right via X or increased investment internationally then the full marks for diagram and explanation are available.	(6)

Question Number	Answer	Mark
1(c)(i)	 Award (2 marks) answers such as: Everyone willing and able to work has a job at the current wage The demand = supply of labour at the market rate There is no involuntary unemployment There is only frictional unemployment 2-5% of people who would like a job can't find one (allow natural rate of unemployment argument). All resources are employed as on PPF curve equilibrium in the labour market 	(2)

Question Number	Answer	Mark
1(c)(ii)	Identification of relevant factor (1 mark).	
	Explanation of link between full capacity and the factor (up to 3 marks). Reason why this is a problem (up to 2 marks). Factors might include:	
	 Inflation, e.g. demand pull and/or cost push 	
	Raise in the interest rate by MPC	
	Wage pressures/costs pressures for firms	
	Current account worsening	
	 Reduced incentives for those in work as income differentials narrow 	
	Environmental impact	
	Infrastructure problems	
	Reduced or slowing growth in investment	
	Social impact of immigration	
	Do not award answers which refer to the effect on productivity	(4)

Question	Answer	Mark
Number		
1(d)	Definition or implicit understanding of supply side or other relevant policies, e.g. tax breaks or action by government as a major employer such as performance related pay. (1 mark)	
	Diagram showing effects of AS shift to the right, or equivalent verbal analysis showing a fall in price level and an increase in real output. (2 marks)	
	6 marks (2 x 3 marks or 3 x 2 marks) effects of supply side or other relevant policies.	
	Evaluation	
	6 marks (2 x 3 marks or 3 x 2 marks). Factors might include:	
	Weighing up benefits and costs	
	Time lag, or other long run effects being different from short run	
	Contrast with demand side approaches. Perhaps interest rates are too high?	
	Other things are not equal, for example high oil prices, weak currency might outweigh any action by government.	
	Limited scope for further supply side policies in the UK.	
	Side effects of policies	(15)
	Difficulty in assessing productivity	
	There is no mark cap for those referring to production, not productivity, in this question.	

Question	Answer	Mark
Number		
2(a)(i)	Total expenditure, spending, or output (1 mark) on goods and services (1 mark)	(2)
	Allow components C+I+G+(X-M) (1 mark)	(2)
	Allow 'planned' (1 mark)	

Question Number	Answer	Mark
2(a)(ii)	For each factor: 1 mark identification, 1 mark explanation of the process involved. (2x2 marks)	
	Mechanisms might include	
	• C or Consumption changes (the following are sensitive to changes in interest rates and will affect consumption - savings, loans, hire purchase, mortgage interest repayments etc.)	
	• I or Investment changes (investment levels change with interest rates, for example if interest rates go up there will be less investment as rewards are reduced. Award 'marginal efficiency of capital')	(4)
	• X-M or Exports - Imports, or net exports changes (changes in costs of production owing to interest rate changes can make exports and imports more or less competitive, or exchange rate arguments: e.g. if the interest rate goes up the pound will get stronger so exports will more expensive and imports less expensive).	

Question Number	Answer	Mark
2(a)(iii)	Analysis (6 marks) of which 2 marks for the diagram. Interest rates have risen i.e. data mark (1 mark);	
	AD will fall shown on appropriate diagram (2 marks, first mark for shift to the left and second mark for changes on the axes) so price level will fall (1 mark) and output will fall (1 mark).	
	Award 2 marks for further explanation such as multiplier, application of text, e.g. 'slowing consumer spending growth to 2.25%', cooling house markets, AS effects or other developed analysis beyond basic transmission mechanisms.	
	Evaluation (2 marks) might include:	
	Time lag - some of these effects might not happen straight away, e.g. if mortgages are fixed	
	The steps are small but the overall effect over the year much greater	
	 Many other things determine shifts in AD, e.g. consumer confidence 	
	Elasticity of AS curve	(8)
	Award prioritisation with justification	

Question	Answer	Mark
Number		
2(b)(i)	The pound has become stronger or 'appreciated' (1 mark) with data reference, e.g. increasing trend, rate of increase, 26-year high, £1 = \$2 (1 mark)	(2)

Question Number	Answer	Mark
2(b)(ii)	Concept of <i>net trade</i> as X-M or similar (1 mark)	
	Exports will be relatively expensive (1 mark)	
	Imports will be relatively cheap (1 mark)	
	The balance worsens (1 mark)	
	Changes in the pattern of trade (1 mark)	
	Also allow further analysis points (up to 2 marks), which might include	
	The pound has not risen against the euro (or equivalent data observation) up to 2 marks	
	The context is narrow - need a wider picture of trade and exchange rates	
	The exchange rate is not the only factor determining net trade	(5)
	AD likely to fall (diagram or equivalent analysis)	(-)

Question Number	Answer	Mark
2(b)(iii)	e.g. labour market pressures, commodity prices, finance markets, exchange rates	
	For each factor (2 x 2 marks): Factors might include: 'Credit crunch' or other credit problems unemployment/employment levels debt savings change in retail sales exogenous shocks regional data the fiscal stance money supply growth commodity prices skills shortages inflation (for explanation mark there must be reference to expected rates or pattern of inflation) performance in other countries level of confidence in the economy allow economic growth figures consumer spending house price changes export and imports levels investment government spending mark for identification (do not allow interest rates	
	unless convincing analysis given!) 1 mark for link to PRICE LEVEL or inflationary pressures	
	Allow max 1 mark for inflation as a source, with a further mark If linked to projected ranges.	
	Do not allow exchange rates as a source of information	(4)

Question Number	Answer	Mark
2(c)	Definition or implicit understanding of tight demand side policy (1 mark)	
	2 marks diagram showing effects of AD shift to the left (1 mark) with price level falling and real output falling (1 mark) or equivalent verbal analysis	
	6 marks (2 x 3 marks) for identification of macroeconomic objectives and explanation (1+2 marks for each). Objectives might include:	
	inflation control	
	• growth	
	 employment/low unemployment 	
	balance of payments equilibrium or improvement	
	 reduction in income inequalities 	
	 environmental objectives 	
	Evaluation	
	6 marks (2 x 3 marks or 3 x 2 marks). Factors might include:	
	Elasticity of AS curve	
	 Monetary policy or fiscal policy might be a blunt instrument 	
	 Time lag, or implementation lag, or other long run effects being different from short run 	
	 Contrast with supply side approaches. Perhaps high interest rates have side effects, e.g. on AS or external economy 	
	Size of the multiplier	
	Side effects of policies	
	 Allow discussion of trade-offs (although not required at AS level) 	
	 Other things are not equal, for example high oil prices, weak currency might outweigh any action by government. 	
		(15)
