

General Certificate of Education  
January 2009  
Advanced Level Examination

**MATHEMATICS**  
**Unit Further Pure 3**

**MFP3**

Wednesday 21 January 2009 1.30 pm to 3.00 pm

**For this paper you must have:**

- a 12-page answer book
  - the blue AQA booklet of formulae and statistical tables.
- You may use a graphics calculator.

Time allowed: 1 hour 30 minutes

**Instructions**

- Use black ink or black ball-point pen. Pencil should only be used for drawing.
- Write the information required on the front of your answer book. The *Examining Body* for this paper is AQA. The *Paper Reference* is MFP3.
- Answer **all** questions.
- Show all necessary working; otherwise marks for method may be lost.

**Information**

- The maximum mark for this paper is 75.
- The marks for questions are shown in brackets.

**Advice**

- Unless stated otherwise, you may quote formulae, without proof, from the booklet.

---

Answer **all** questions.

---

1 The function  $y(x)$  satisfies the differential equation

$$\frac{dy}{dx} = f(x, y)$$

where

$$f(x, y) = \frac{x^2 + y^2}{x + y}$$

and

$$y(1) = 3$$

(a) Use the Euler formula

$$y_{r+1} = y_r + hf(x_r, y_r)$$

with  $h = 0.2$ , to obtain an approximation to  $y(1.2)$ . (3 marks)

(b) Use the improved Euler formula

$$y_{r+1} = y_r + \frac{1}{2}(k_1 + k_2)$$

where  $k_1 = hf(x_r, y_r)$  and  $k_2 = hf(x_r + h, y_r + k_1)$  and  $h = 0.2$ , to obtain an approximation to  $y(1.2)$ , giving your answer to four decimal places. (5 marks)

2 (a) Show that  $\frac{1}{x^2}$  is an integrating factor for the first-order differential equation

$$\frac{dy}{dx} - \frac{2}{x}y = x \quad (3 \text{ marks})$$

(b) Hence find the general solution of this differential equation, giving your answer in the form  $y = f(x)$ . (4 marks)

- 3 The diagram shows a sketch of a loop, the pole  $O$  and the initial line.

The polar equation of the loop is

$$r = (2 + \cos \theta)\sqrt{\sin \theta}, \quad 0 \leq \theta \leq \pi$$

Find the area enclosed by the loop.

(6 marks)

- 4 (a) Use integration by parts to show that  $\int \ln x \, dx = x \ln x - x + c$ , where  $c$  is an arbitrary constant. (2 marks)
- (b) Hence evaluate  $\int_0^1 \ln x \, dx$ , showing the limiting process used. (4 marks)

- 5 The diagram shows a sketch of a curve  $C$ , the pole  $O$  and the initial line.

The curve  $C$  has polar equation

$$r = \frac{2}{3 + 2 \cos \theta}, \quad 0 \leq \theta \leq 2\pi$$

- (a) Verify that the point  $L$  with polar coordinates  $(2, \pi)$  lies on  $C$ . (1 mark)
- (b) The circle with polar equation  $r = 1$  intersects  $C$  at the points  $M$  and  $N$ .
- (i) Find the polar coordinates of  $M$  and  $N$ . (3 marks)
- (ii) Find the area of triangle  $LMN$ . (4 marks)
- (c) Find a cartesian equation of  $C$ , giving your answer in the form  $9y^2 = f(x)$ . (5 marks)

**Turn over for the next question**

**Turn over ►**

6 The function  $f$  is defined by  $f(x) = e^{2x}(1 + 3x)^{-\frac{2}{3}}$ .

(a) (i) Use the series expansion for  $e^x$  to write down the first four terms in the series expansion of  $e^{2x}$ . (2 marks)

(ii) Use the binomial series expansion of  $(1 + 3x)^{-\frac{2}{3}}$  and your answer to part (a)(i) to show that the first three non-zero terms in the series expansion of  $f(x)$  are  $1 + 3x^2 - 6x^3$ . (5 marks)

(b) (i) Given that  $y = \ln(1 + 2 \sin x)$ , find  $\frac{d^2y}{dx^2}$ . (4 marks)

(ii) By using Maclaurin's theorem, show that, for small values of  $x$ ,

$$\ln(1 + 2 \sin x) \approx 2x - 2x^2 \quad (2 \text{ marks})$$

(c) Find

$$\lim_{x \rightarrow 0} \frac{1 - f(x)}{x \ln(1 + 2 \sin x)} \quad (3 \text{ marks})$$

7 (a) Given that  $x = e^t$  and that  $y$  is a function of  $x$ , show that

$$x^2 \frac{d^2y}{dx^2} = \frac{d^2y}{dt^2} - \frac{dy}{dt} \quad (7 \text{ marks})$$

(b) Hence show that the substitution  $x = e^t$  transforms the differential equation

$$x^2 \frac{d^2y}{dx^2} - 4x \frac{dy}{dx} = 10$$

into

$$\frac{d^2y}{dt^2} - 5 \frac{dy}{dt} = 10 \quad (2 \text{ marks})$$

(c) Find the general solution of the differential equation  $\frac{d^2y}{dt^2} - 5 \frac{dy}{dt} = 10$ . (5 marks)

(d) Hence solve the differential equation  $x^2 \frac{d^2y}{dx^2} - 4x \frac{dy}{dx} = 10$ , given that  $y = 0$  and  $\frac{dy}{dx} = 8$  when  $x = 1$ . (5 marks)

**END OF QUESTIONS**
