# 4730 

Mechanics 3
Tuesday 10 JANUARY 2006
Afternoon
1 hour 30 minutes
Additional materials:
8 page answer booklet
Graph paper
List of Formulae (MF1)

TIME 1 hour 30 minutes

## INSTRUCTIONS TO CANDIDATES

- Write your name, centre number and candidate number in the spaces provided on the answer booklet.
- Answer all the questions.
- Give non-exact numerical answers correct to 3 significant figures unless a different degree of accuracy is specified in the question or is clearly appropriate.
- The acceleration due to gravity is denoted by $\mathrm{g} \mathrm{m} \mathrm{s}^{-2}$. Unless otherwise instructed, when a numerical value is needed, use $g=9.8$.
- You are permitted to use a graphical calculator in this paper.

## INFORMATION FOR CANDIDATES

- The number of marks is given in brackets [ ] at the end of each question or part question.
- The total number of marks for this paper is 72 .
- Questions carrying smaller numbers of marks are printed earlier in the paper, and questions carrying larger numbers of marks later in the paper.
- You are reminded of the need for clear presentation in your answers.

A particle $P$ of mass 0.4 kg moving in a straight line has speed $8.7 \mathrm{~m} \mathrm{~s}^{-1}$. An impulse applied to $P$ deflects it through $45^{\circ}$ and reduces its speed to $5.4 \mathrm{~m} \mathrm{~s}^{-1}$ (see diagram). Calculate the magnitude and direction of the impulse exerted on $P$.
$2 \quad O$ is a fixed point on a horizontal straight line. A particle $P$ of mass 0.5 kg is released from rest at $O$. At time $t$ seconds after release the only force acting on $P$ has magnitude $\left(1+k t^{2}\right) \mathrm{N}$ and acts horizontally and away from $O$ along the line, where $k$ is a positive constant.
(i) Find the speed of $P$ in terms of $k$ and $t$.
(ii) Given that $P$ is 2 m from $O$ when $t=1$, find the value of $k$ and the time taken by $P$ to travel 20 m from $O$.

3 A light elastic string has natural length 3 m . One end is attached to a fixed point $O$ and the other end is attached to a particle of mass 1.6 kg . The particle is released from rest in a position 5 m vertically below $O$. Air resistance may be neglected.
(i) Given that in the subsequent motion the particle just reaches $O$, show that the modulus of elasticity of the string is 117.6 N .
(ii) Calculate the speed of the particle when it is 4.5 m below $O$.

Two uniform smooth spheres $A$ and $B$, of equal radius, have masses 5 kg and 2 kg respectively. They are moving on a horizontal surface when they collide. Immediately before the collision, $A$ has speed $4 \mathrm{~m} \mathrm{~s}^{-1}$ and is moving perpendicular to the line of centres, and $B$ has speed $4 \mathrm{~m} \mathrm{~s}^{-1}$ along the line of centres (see diagram). The coefficient of restitution is 0.75 . Find the speed and direction of motion of each sphere immediately after the collision.

Two uniform rods $A B$ and $B C$ have weights 64 N and 40 N respectively. The rods are freely jointed to each other at $B$. The $\operatorname{rod} A B$ is freely jointed to a fixed point on horizontal ground at $A$ and the rod $B C$ rests against a vertical wall at $C$. The rod $B C$ is 1.8 m long and is horizontal. A particle of weight 9 N is attached to the $\operatorname{rod} B C$ at the point 0.4 m from $C$. The point $A$ is 1.2 m below the level of $B C$ and 3.8 m from the wall (see diagram). The system is in equilibrium.
(i) Show that the magnitude of the frictional force at $C$ is 27 N .
(ii) Calculate the horizontal and vertical components of the force exerted on $A B$ at $B$.
(iii) Given that friction is limiting at $C$, find the coefficient of friction between the $\operatorname{rod} B C$ and the wall.

One end of a light inextensible string of length 0.5 m is attached to a fixed point $O$. A particle $P$ of mass 0.3 kg is attached to the other end of the string. With the string taut and at an angle of $60^{\circ}$ to the upward vertical, $P$ is projected with speed $2 \mathrm{~m} \mathrm{~s}^{-1}$ (see diagram). $P$ begins to move without air resistance in a vertical circle with centre $O$. When the string makes an angle $\theta$ with the upward vertical, the speed of $P$ is $v \mathrm{~m} \mathrm{~s}^{-1}$.
(i) Show that $v^{2}=8.9-9.8 \cos \theta$.
(ii) Find the tension in the string in terms of $\theta$.
(iii) $P$ does not move in a complete circle. Calculate the angle through which $O P$ turns before $P$ leaves the circular path.

7

As shown in the diagram, $A$ and $B$ are fixed points on a smooth horizontal table, where $A B=3 \mathrm{~m}$. A particle $Q$ of mass 1.2 kg is attached to $A$ by a light elastic string of natural length 1 m and modulus of elasticity $180 \mathrm{~N} . Q$ is attached to $B$ by a light elastic string of natural length 1.2 m and modulus of elasticity 360 N .
(i) Verify that when $Q$ is in equilibrium $B Q=1.5 \mathrm{~m}$.
$Q$ is projected towards $B$ from the equilibrium position with speed $u \mathrm{~m} \mathrm{~s}^{-1}$. Subsequently $Q$ oscillates with simple harmonic motion.
(ii) Show that the period of the motion is 0.314 s approximately.
(iii) Show that $u \leqslant 6$.
(iv) Given that $u=6$, find the time taken for $Q$ to move from the equilibrium position to a position 1.3 m from $A$ for the first time.
