PHYSICS (SPECIFICATION A) **PHA9/W**
Unit 9 Nuclear Instability: Electronics Option

Wednesday 11 June 2008 9.00 am to 10.15 am

For this paper you must have:
- a calculator
- a pencil and a ruler
- a data sheet loose insert.

Time allowed: 1 hour 15 minutes

Instructions
- Use black ink or black ball-point pen.
- Fill in the boxes at the top of this page.
- Answer **all** questions.
- You must answer questions in the spaces provided. Answers written in margins or on blank pages will not be marked.
- Show all your working.
- Do all rough work in this book. Cross through any work you do not want to be marked.

Information
- The maximum mark for this paper is 40. This includes up to two marks for the Quality of Written Communication.
- The marks for questions are shown in brackets.
- A *Data Sheet* is provided as a loose insert to this question paper.
- You are expected to use a calculator where appropriate.
- Question 1(c) and 5(b) should be answered in continuous prose. In these questions you will be marked on your ability to use good English, to organise information clearly and to use specialist vocabulary where appropriate.

SECTION A: NUCLEAR INSTABILITY

Answer **all** of this question.

1 (a) An isotope of technetium ${}^{99}_{43}\mathrm{Tc}^{m}$, which is in a metastable state, decays emitting only γ rays. When the isotope is placed 20 cm from a γ ray detector the count rate is 25 counts per second. The background count rate is 120 counts per minute. Calculate the count rate, in counts per second, when the detector is placed 30 cm from the isotope.

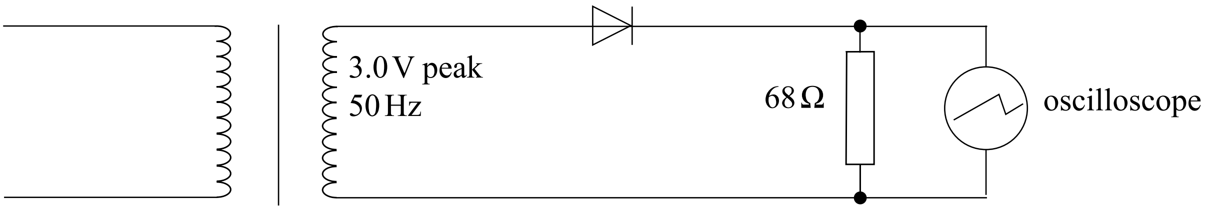
SECTION B: ELECTRONICS

Answer **all** questions.

2 **Figure 1** shows a half-wave rectified power supply. The transformer in the power supply has a peak output of 3.0 V at a frequency of 50 Hz. The power supply is connected to a 68 Ω load resistor. The pd across the load resistor is displayed on an oscilloscope.

Figure 1



2 (a) Explain why the peak voltage across the load resistor is about 2.3 V.

....
