Physics

Assessment Unit A2 2

assessing

Fields and their Applications

[AY221]

MONDAY 9 JUNE, MORNING

TIME

1 hour 30 minutes.

INSTRUCTIONS TO CANDIDATES

Write your Centre Number and Candidate Number in the spaces provided at the top of this page.

Answer all questions.

Write your answers in the spaces provided in this question paper.

INFORMATION FOR CANDIDATES

The total mark for this paper is 90.

Quality of written communication will be assessed in Question **4(c)(ii)**. Figures in brackets printed down the right-hand side of pages indicate the marks awarded to each question.

Your attention is drawn to the Data and Formulae Sheet which is inside this question paper.

You may use an electronic calculator.

Question 7 contributes to the synoptic assessment required of the specification. Candidates should allow approximately 15 minutes to complete this question.

For Examiner's use only

Marks	

1	(a)	De	fine gravitational field strength.	Exa Mark
				[1]
	(b)	(i)	The Moon has a radius of 1.74 \times 10 ⁶ m and a mass of 7.35 \times 10 ²² kg. Calculate the gravitational field strength on the surface of the Moon.	

Gravitational field strength =	N kg ^{−1}	[3]
Oravitational field strength —	IN NY	[ب]

(ii) The Moon moves in a circular orbit of mean radius of 3.84×10^8 m around the Earth. The mass of the Earth is 5.98×10^{24} kg. Show that the force on the Moon due to the Earth is 1.99×10^{20} N.

[3]

(iii) Calculate the period of the Moon's orbit around the Earth in days.

Period = _____ days

[3]

	[2]

2 (a) (i) State one similarity and one difference in the force produced by electric and gravitational fields.

Examin	er Only
Marks	Remark

Similarity _			
Difference _			

_____[2]

[1]

(ii) Write down the equation used to calculate the magnitude of the force that exists between two point charges. Identify all the symbols used and state the name of the law that this equation represents.

(b) (i) On **Fig. 2.1**, sketch a graph showing how the electric field strength *E* due to a point charge varies with the distance *r* from the charge.

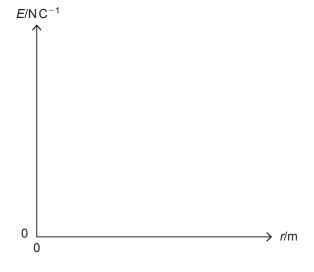

Fig. 2.1

8963.07

A point charge of $-3\,\mu\text{C}$ is placed 20 mm from a point charge of $+4\,\mu\text{C}$, see **Fig. 2.2**.

Examin	er Only
Marks	Remark

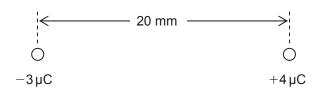

Fig. 2.2

(ii) Calculate the magnitude and direction of the resultant electric field strength at point A midway between the two charges.

Electric field strength =
$$NC^{-1}$$
 [3]

3 (a) A capacitor of capacitance 330 μF is charged from a 40 V power supply.

Examin	er Only
Marks	Remark

(i) How much charge is stored by the capacitor?

(ii) What would be the maximum energy stored by this capacitor?

Energy =
$$\bigcup$$
 [2]

(b) Fig. 3.1 shows a network of capacitors each of capacitance 330 μ F. Calculate the capacitance between A and B.

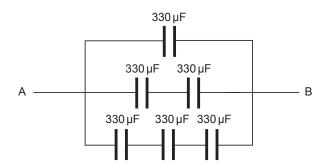

Fig. 3.1

Capacitance =
$$\mu$$
F [2]

(c) Fig. 3.2 shows a circuit containing a capacitor of capacitance C, a resistor of resistance R, a supply voltage V_s and two switches S_1 and S_2 .

Examiner Only

Marks Remark

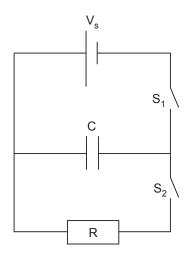

Fig. 3.2

When switch S_1 is closed the capacitor is charged by the battery.

(i) Explain how the capacitor is charged in terms of the movement of charge.

_____[3]

(ii) On Fig. 3.3 sketch a graph to show how the potential difference V across the capacitor plates varies with time t during the charging process. Switch S_1 is closed at time t = 0.

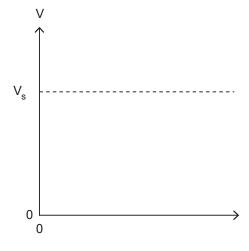

Fig. 3.3

	swit disc	ch S_1 is then opened. When switch S_2 is closed the capacitor charges through the resistor R and the potential difference V_C		Examin Marks	er Only Remark
		What effect does the resistor have on the discharge of the capacitor?			
			[1]		
	(iv)	Define the time constant $\boldsymbol{\tau}$ of the circuit in terms of the variation the potential difference across the capacitor with time as it discharges.	of		
			[1]		
(d)	cap diffe	70 μF capacitor is charged to a potential difference of 200 V. The acitor is discharged through a resistor R. After 12s, the potential erence across the capacitor has fallen to 74 V. Calculate the stance of resistor R in $k\Omega$.			
	Res	sistance = $\underline{\hspace{1cm}}$ k Ω	[3]		

8963.07

<i>a</i> , D.	efine the weber.	
_		[2]
	g. 4.1 shows a current carrying wire between two magnetic poles ne direction of the current in the wire is out of the page.	S.
	N S	
	Fig. 4.1	
(i)	State the direction of the force on the current carrying wire.	[1]
(ii	The wire carries a current of 3.0A. The length of the wire in the field is 5.0 cm and it experiences a force of 0.03 N. Calculate the strength of the magnetic field in millitesla.	

(c)	(i)	State Lenz's Law of electromagnetic induction.	Examiner C Marks Re	Only emark
		[1]		
	(ii)	State what happens as the N pole of the bar magnet approaches the coil, as shown in Fig. 4.2 and explain how this is consistent with Lenz's Law.		
		sensitive microammeter		
		bar magnet Sensitive microanimeter A Coil of wire		
		Fig. 4.2		
		[2]		
		Quality of written communication [2]		

(d)	A flat circular multi-turn coil with a total resistance of 20 Ω has 50 turns and an area of 80 cm ² . The coil is placed perpendicular to a uniform magnetic field of 0.3 T.				
	(i)	Calculate the total flux linkage through the multi-turn coil.			
		Flux linkage = Wb	[3]		
	(ii)	Calculate the induced e.m.f. if the magnetic field is reduce zero in 50 ms.	d to		
		Induced e.m.f. =V	[2]		
	(iii)	Calculate the induced current.			
		Induced current =A	[1]		

(a)	A cathode ray oscilloscope (CRO) is used extensively by physicists to display electrical signals. Outline the basic structure of the CRO.	Examin Marks	er R
(b)	A beam of electrons in an evacuated tube enters the uniform electric field provided by a potential difference of 600 V applied across two parallel plates 50 mm apart. The beam is deflected by the electric field until a uniform magnetic field of 0.72 mT perpendicular to the beam is		
	applied to cancel the deflection and straighten the beam. Calculate the speed of the beam in the field.		
	Velocity of beam of electrons = ms ⁻¹ [5		

BLANK PAGE

(Questions continue overleaf)

6 A linear particle accelerator is a type of particle accelerator that increases the speed of subatomic particles. **Fig. 6.1** illustrates the main features of a linear accelerator.

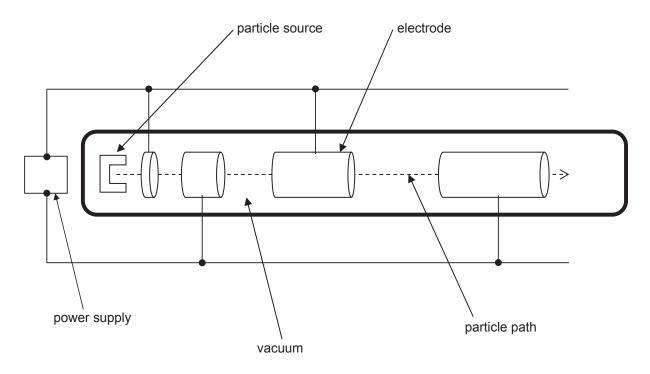

Fig. 6.1

(a)	Why is it necessary for the chamber to be a vacuum?	
		[1]

Examin	er Only
Marks	Remark

(b)		scribe and explain how the speed of a subatomic particle is		ner Only
	inc	reased by a linear particle accelerator.	Marks	Remark
			[5]	
(c)	Lep	otons and hadrons are two groups of subatomic particles.		
	/:\	State two differences between lentene and bodrons		
	(i)	State two differences between leptons and hadrons.		
			[2]	
			[-]	
	<i>(</i> 111)			
	(11)	Hadrons can be subdivided into two types. Name the two types hadrons and give a specific example of each type.	Of	
		riadions and give a specific example of each type.		
			[2]	

7	7 (a) Stokes' Law is used in the study of the velocity of an object through a fluid. When a small, spherical ball bearing is releasely glycerol it accelerates at first but its velocity soon reaches a		
		value, known as the terminal velocity. Fig. 7.1 shows the forces acting on the ball bearing as it falls. Viscous drag is the name given to the frictional force that exists between an object and the fluid through	

which it moves.

Examiner Only

Marks Remark

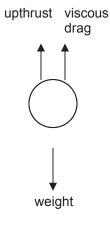

Fig. 7.1

(i)	When the ball bearing drops at a constant speed, state the
	relationship between the three forces labelled in Fig. 7.1.

_______[1]

(ii) Stokes showed that the viscous drag F_v acting on a sphere of radius r, dropped through a fluid of viscosity η and moving with velocity v is given by **Equation 7.1**. Viscosity is the property of a fluid that measures how much it opposes the motion of an object through it.

$$F_{v} = 6\pi r \eta v$$
 Equation 7.1

Determine the base unit of viscosity η .

Base unit of
$$\eta =$$

[2]

(iii) The upthrust F_U is equivalent to the **weight** of fluid displaced by the ball bearing as it falls. Derive an expression for the upthrust force experienced by the ball bearing in terms of the density of the fluid ρ_f through which the ball bearing moves, the radius r of the ball bearing and such physical constants as are required. N.B. The volume of a sphere $V = 4\pi r^3/3$

Examiner Only			
Marks	Remark		

$$F_{U} = \underline{\hspace{1cm}}$$
 [2]

- (iv) On the axes of Fig. 7.2, sketch two graphs:
 - one to show how the velocity of an object falling from rest in a vacuum varies with time. Label this graph V.
 - a second to show how the velocity of an object falling from rest in a fluid varies with time. Label this graph F.

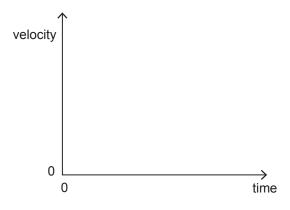

Fig. 7.2

[2]

(v) Calculate the terminal velocity of a steel ball bearing of radius $3.0\,\mathrm{mm}$ falling through glycerol. The density of steel is $8000\,\mathrm{kg}\,\mathrm{m}^{-3}$ and the density of glycerol is $1300\,\mathrm{kg}\,\mathrm{m}^{-3}$. The viscosity of glycerol at room temperature is $1.5\,\mathrm{S.I.}$ units. The upthrust experienced by the ball bearing at terminal velocity is $1.44\,\mathrm{mN.}$

Examiner Only		
Marks	Remark	

Terminal velocity =	$\mathrm{m}\mathrm{s}^{-1}$	[3]
Terminal velocity —	1113	191

- (b) A very small steel ball bearing of radius 1.2 mm and mass 5.79×10^{-5} kg attains a terminal velocity of 1400 m s⁻¹ in air.
 - (i) Calculate the wavelength associated with the ball bearing moving at terminal velocity through the air.

Wavelength
$$=$$
 _____ m [2]

(11)	motion of the ball bearing as it falls.	Examine Marks	r Only Remark
(iii)	Use Einstein's mass—energy equivalency principle to calculate the difference between the ball bearing's mass when stationary and its mass when moving at terminal velocity and indicate whether it becomes heavier or lighter by ticking the appropriate box in the answer line.		
	Mass difference = kg Heavier ☐ Lighter ☐ [3]		
тні	S IS THE END OF THE QUESTION PAPER

GCE Physics

Data and Formulae Sheet for A2 1 and A2 2

Values of constants

speed of light in a vacuum $c = 3.00 \times 10^8 \text{ m s}^{-1}$

permittivity of a vacuum $\varepsilon_0 = 8.85 \times 10^{-12} \, \mathrm{F \ m^{-1}}$

 $\left(\frac{1}{4\pi\varepsilon_0} = 8.99 \times 10^9 \text{ F}^{-1} \text{ m}\right)$

elementary charge $e = 1.60 \times 10^{-19} \text{ C}$

the Planck constant $h = 6.63 \times 10^{-34} \text{ J s}$

(unified) atomic mass unit $1 \text{ u} = 1.66 \times 10^{-27} \text{ kg}$

mass of electron $m_{\rm e}$ = 9.11 \times 10⁻³¹ kg

mass of proton $m_{\rm p}$ = 1.67 × 10⁻²⁷ kg

molar gas constant $R = 8.31 \text{ J K}^{-1} \text{ mol}^{-1}$

the Avogadro constant $N_A = 6.02 \times 10^{23} \text{ mol}^{-1}$

the Boltzmann constant $k = 1.38 \times 10^{-23} \text{ J K}^{-1}$

gravitational constant $G = 6.67 \times 10^{-11} \text{ N m}^2 \text{ kg}^{-2}$

acceleration of free fall on

the Earth's surface $g = 9.81 \text{ m s}^{-2}$

electron volt $1 \text{ eV} = 1.60 \times 10^{-19} \text{ J}$

The following equations may be useful in answering some of the questions in the examination:

Mechanics

Conservation of energy $\frac{1}{2}mv^2 - \frac{1}{2}mu^2 = Fs$ for a constant force

Hooke's Law F = kx (spring constant k)

Simple harmonic motion

Displacement $x = A \cos \omega t$

Sound

Sound intensity level/dB = 10 $\lg_{10} \frac{I}{I_0}$

Waves

Two-source interference $\lambda = \frac{ay}{d}$

Thermal physics

Average kinetic energy of a

molecule $\frac{1}{2} m \langle c^2 \rangle = \frac{3}{2} kT$

Kinetic theory $pV = \frac{1}{3} Nm \langle c^2 \rangle$

Thermal energy $Q = mc\Delta\theta$

Capacitors

Capacitors in series $\frac{1}{C} = \frac{1}{C_1} + \frac{1}{C_2} + \frac{1}{C_3}$

Capacitors in parallel $C = C_1 + C_2 + C_3$

Time constant $\tau = RC$

Light

$$\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$$

$$m = \frac{V}{U}$$

Electricity

$$V = E - Ir$$
 (e.m.f. E; Internal Resistance r)

$$V_{\text{out}} = \frac{R_1 V_{\text{in}}}{R_1 + R_2}$$

Particles and photons

$$A = \lambda N$$

$$A = A_0 e^{-\lambda t}$$

$$t_{\frac{1}{2}} = \frac{0.693}{\lambda}$$

$$\lambda = \frac{h}{p}$$

The nucleus

$$r = r_0 A^{\frac{1}{3}}$$
