Advanced Level
Unit Test PHY5 Practical Test
Group 1
Monday 18 May 2009 - Afternoon
Time: 1 hour 30 minutes

Instructions to Candidates

In the boxes above, write your centre number, candidate number, your surname, other names and signature.
PHY5 consists of questions A, B and C. Each question is allowed 20 minutes plus 5 minutes writing-up time. There is a further 15 minutes for writing-up at the end. The Supervisor will tell you which experiment to attempt first.

Write all your results, calculations and answers in the spaces provided in this question booklet.

In calculations you should show all the steps in your working, giving your answer at each stage.
Information for Candidates
The marks for individual questions and the parts of questions are shown in round brackets.
The total mark for this paper is 48 .
The list of data, formulae and relationships is printed at the end of this booklet.

## Question 1A

(a) (i) Measure the height of the capillary tube outlet above the bench.

Measure the height above the bench of the zero mark on the burette.

Hence calculate the height $h_{0}$ of the zero mark above the capillary outlet.
$\qquad$
(ii) Ensure that the burette is filled to the zero mark. You may run out water into the top-up beaker or add water to the burette using water from the beaker.

You are to determine the height of the water above the capillary outlet after it has been flowing out of the burette for different times.

Open the tap and allow water to run out of the burette for 15.0 s and close the tap. Measure the height of the water in the burette above the bench.

Without disturbing the arrangement, refill the burette to the zero mark using water from the top-up beaker and repeat your reading.
$\qquad$
$\qquad$
$\qquad$
$\qquad$

Hence determine a mean value for the height $h_{1}$ of the water in the burette above the capillary outlet.

Hence

Now refill the burette to the zero mark and take measurements to find the height $h_{2}$ of the water in the burette above the capillary outlet after 30.0 s .
$\qquad$
$\qquad$
$\qquad$
$\qquad$
Calculate the ratios $h_{0} / h_{1}$ and $h_{1} / h_{2}$.
$\qquad$
$\qquad$
$\qquad$
(iii) It is suggested that these two ratios should be the same. Calculate the percentage difference between the two ratios and explain whether your readings support the suggestion.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
(2)

QUESTION 1A CONTINUES ON THE NEXT PAGE
(b) (i) The circuit shown below has been set up for you. Identify the points in the circuit labelled A, X, and Y.

Use the spare lead to connect point X to point Y . Record the current $I_{0}$.
$I_{0}=$ $\qquad$
Disconnect the spare lead from X and Y .
Write down the value of $I_{0} / 2$ and $I_{0} / 4$.
$I_{0} / 2=$

$$
I_{0} / 4=
$$

$\qquad$
You are to measure the time it takes for the current $I$ to fall to $I_{0} / 2$ and $I_{0} / 4$ as the capacitor discharges through the resistor.

Charge the capacitor by connecting point A to point X for a short time. Then disconnect A from X , and discharge the capacitor by connecting point A to point Y. As you make this connection start the stopwatch.

Record your values in the first two columns of the table below.

|  | $t_{1} / \mathrm{s}=$ time when $I=I_{0} / 2$ | $t_{2} / \mathrm{s}=$ time when $I=I_{0} / 4$ | $t_{3} / \mathrm{s}=\left(t_{2}-t_{1}\right) / \mathrm{s}$ |
| :--- | :--- | :--- | :--- |
|  |  |  |  |
|  |  |  |  |
| Mean values |  |  |  |

Hence calculate $t_{3}$, the time to fall from $I_{0} / 2$ to $I_{0} / 4$. Show these values in the third column.
(ii) Estimate the uncertainties in your values for $t_{1}$ and $t_{3}$. Use these to comment on the suggestion that $t_{1}$ and $t_{3}$ should be the same.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
(2)

## Question 1B

(a) Read room temperature $\theta$ using the thermometer.
$\theta=$ $\qquad$
The circuit shown in the diagram below has been set up for you.

(b) Connect the battery and adjust the variable resistor until the current $I$ is 5.0 mA . Record below the corresponding reading $V$ on the voltmeter.

You are to take readings of $V$ for different values of $I$ between 5.0 mA and approximately 50 mA . Record your readings for $V$ and $I$ below. Disconnect the battery after you have taken your readings.

| $I / \mathrm{mA}$ | $V / \mathrm{V}$ | $\ln (I / \mathrm{mA})$ |
| :---: | :--- | :--- |
| 5.0 |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |

(c) It is suggested that the values of $V$ and $I$ are related by the equation

$$
I=I_{0} \mathrm{e}^{a V}
$$

and hence

$$
\ln I=a V+\ln I_{0}
$$

where $I_{0}$ and $a$ are constants.
Calculate the values of $\ln I$ and tabulate these in the third column
Plot a graph of $\ln I$ against $V$ on the grid below.

## QUESTION 1B CONTINUES ON THE NEXT PAGE

## Question 1C

You are to plan an experiment on a sample of gas using computer technology to capture the data. You will then analyse a set of data from a similar experiment.
(a) A sample of gas is held in a container at constant volume. The pressure of the gas is monitored by a pressure sensor mounted through the top of the container. The temperature of the gas is varied by placing the container in a water bath and the temperature of the bath is monitored by a temperature sensor. The output from each sensor is sent to a computer to record the data.

Draw a block diagram to show how the data is fed to the computer.

The temperature is to be varied from the ice point to the boiling point of the water.
How should the computer be used to record an appropriate set of data for this experiment?
$\qquad$
$\qquad$
$\qquad$
Suggest two experimental precautions that you would take to ensure that the data are accurate.
$\qquad$
$\qquad$
(b) By considering the Ideal Gas Equation

$$
p V=n R T
$$

explain why a graph of $p$ against $T$ will be a straight line through the origin.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
Write down the expression for the gradient of such a graph.
$\qquad$
(c) In such an experiment the following data were recorded.

| $\theta /{ }^{\circ} \mathrm{C}$ | $p / \mathrm{kPa}$ |  |
| :---: | :---: | :--- |
| 0 | 101 |  |
| 10 | 105 |  |
| 22 | 110 |  |
| 37 | 115 |  |
| 47 | 118 |  |
| 61 | 124 |  |
| 75 | 129 |  |
| 87 | 133 |  |
| 100 | 138 |  |

Plot a graph of $p$ against $T$ on the grid opposite. Use the additional column for any processed data.

List of data, formulae and relationships

## Data

Speed of light in vacuum
Gravitational constant
Acceleration of free fall
Gravitational field strength
Elementary (proton) charge
Electronic mass
Electronvolt
Planck constant
Unified atomic mass unit
Molar gas constant
Permittivity of free space
Coulomb law constant

Permeability of free space

$$
\begin{aligned}
c & =3.00 \times 10^{8} \mathrm{~m} \mathrm{~s}^{-1} \\
G & =6.67 \times 10^{-11} \mathrm{~N} \mathrm{~m}^{2} \mathrm{~kg}^{-2} \\
g & =9.81 \mathrm{~m} \mathrm{~s}^{-2} \\
g & =9.81 \mathrm{~N} \mathrm{~kg}^{-1} \\
e & =1.60 \times 10^{-19} \mathrm{C} \\
m_{\mathrm{e}} & =9.11 \times 10^{-31} \mathrm{~kg} \\
1 \mathrm{VV} & =1.60 \times 10^{-19} \mathrm{~J} \\
h & =6.62 \times 10^{-34} \mathrm{~J} \mathrm{~s} \\
\mathrm{u} & =1.66 \times 10^{-27} \mathrm{~kg}^{2} \\
R & =8.31 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1} \\
\varepsilon_{0} & =8.85 \times 10^{-12} \mathrm{Fm}^{-1} \\
k & =1 / 4 \pi \varepsilon_{0} \\
& =8.99 \times 10^{9} \mathrm{~N} \mathrm{~m}^{2} \mathrm{C}^{-2} \\
\mu_{0} & =4 \pi \times 10^{-7} \mathrm{NA}^{-2}
\end{aligned}
$$

$$
g=9.81 \mathrm{~m} \mathrm{~s}^{-2} \quad \text { (close to the Earth) }
$$

(close to the Earth)

## Rectilinear motion

For uniformly accelerated motion:

$$
\begin{aligned}
v & =u+a t \\
x & =u t+\frac{1}{2} a t^{2} \\
v^{2} & =u^{2}+2 a x
\end{aligned}
$$

## Forces and moments

Moment of $F$ about $\mathrm{O}=F \times($ Perpendicular distance from $F$ to O$)$
Sum of clockwise moments $=$ Sum of anticlockwise moments about any point in a plane about that point

## Dynamics

$$
\text { Force } \quad F=m \frac{\Delta v}{\Delta t}=\frac{\Delta p}{\Delta t}
$$

Impulse
$F \Delta t=\Delta p$

Mechanical energy

$$
\text { Power } \quad P=F v
$$

Radioactive decay and the nuclear atom
Activity
$A=\lambda N$
(Decay constant $\lambda$ )
Half-life
$\lambda t_{\frac{1}{2}}=0.69$

## Electrical current and potential difference

| Electric current | $I=n A Q v$ |
| :--- | :--- |
| Electric power | $P=I^{2} R$ |

## Electrical circuits

| Terminal potential difference | $V=\varepsilon-I r$ | (E.m.f. $\mathcal{E}$; Internal resistance $r$ ) |
| :---: | :---: | :---: |
| Circuit e.m.f. | $\Sigma \varepsilon=\Sigma I R$ |  |
| Resistors in series | $R=R_{1}+R_{2}+R_{3}$ |  |
| Resistors in parallel | $\frac{1}{R}=\frac{1}{R_{1}}+\frac{1}{R_{2}}+\frac{1}{R_{3}}$ |  |

## Heating matter

Change of state: $\quad$ energy transfer $=l \Delta m \quad$ (Specific latent heat or specific enthalpy change $l$ )
Heating and cooling:
energy transfer $=m c \Delta T \quad($ Specific heat capacity $c$; Temperature change $\Delta T)$

$$
\theta /{ }^{\circ} \mathrm{C}=T / \mathrm{K}-273
$$

## Kinetic theory of matter

Temperature and energy $\quad T \propto$ Average kinetic energy of molecules

Kinetic theory $\quad p=\frac{1}{3} \rho\left\langle c^{2}\right\rangle$

## Conservation of energy

| Change of internal energy | $\Delta U$ | $=\Delta Q+\Delta W$ |  |
| :--- | :--- | ---: | :--- |
| Efficiency of energy transfer | $=\frac{\text { Useful output }}{\text { Input }}$ |  |  |
| Heat engine maximum efficiency | $=\frac{T_{1}-T_{2}}{T_{1}}$ |  |  |

## Circular motion and oscillations

| Angular speed $\omega=\frac{\Delta \theta}{\Delta t}=\frac{v}{r}$ | (Radius of circular path $r$ ) |
| :---: | :---: |
| Centripetal acceleration $\quad a=\frac{v^{2}}{r}$ |  |
| Period $\quad T=\frac{1}{f}=\frac{2 \pi}{\omega}$ | (Frequency $f$ ) |
| Simple harmonic motion: |  |
| $\begin{aligned} \text { displacement } x & =x_{0} \cos 2 \pi f t \\ \text { maximum speed } & =2 \pi f x_{0} \\ \text { acceleration } a & =-(2 \pi f)^{2} x \end{aligned}$ |  |
| For a simple pendulum $\quad T=2 \pi \sqrt{\frac{l}{g}}$ |  |
| For a mass on a spring $\quad T=2 \pi \sqrt{\frac{m}{k}}$ | (Spring constant $k$ ) |

## Waves

Intensity

$$
I=\frac{P}{4 \pi r^{2}}
$$

(Distance from point source $r$; Power of source $P$ )

## Superposition of waves

| Two slit interference | $\lambda=\frac{x s}{D}$ | (Wavelength $\lambda$; Slit separation $s$ <br> Fringe width $x$; Slits to screen distance $D$ ) |
| :---: | :---: | :---: |

## Quantum phenomena

| Photon model | $E=h f$ | (Planck constant $h$ ) |
| :--- | ---: | ---: |
| Maximum energy of photoelectrons | $=h f-\varphi$ | (Work function $\varphi$ ) |
| Energy levels | $h f=E_{1}-E_{2}$ |  |
| de Broglie wavelength | $\lambda=\frac{h}{p}$ |  |

## Observing the Universe

Doppler shift

$$
\frac{\Delta f}{f}=\frac{\Delta \lambda}{\lambda} \approx \frac{v}{c}
$$

Hubble law $\quad v=H d \quad$ (Hubble constant $H$ )

## Gravitational fields

Gravitational field strength
for radial field

$$
g=F / m
$$

$g=G m / r^{2}$, numerically $\quad$ (Gravitational constant $G$ )

## Electric fields

| Electrical field strength | $E$ | $=F / Q$ |
| ---: | :--- | ---: | :--- |
| for radial field | $E$ | $=k Q / r^{2}$ |
| for uniform field | $E$ | $=V / d$ |
| For an electron in a vacuum tube | $e \Delta V$ | $=\Delta\left(\frac{1}{2} m_{\mathrm{e}} v^{2}\right)$ |$\quad$ (Coulomb law constant $k$ )

## Capacitance

Energy stored
Capacitors in parallel

$$
W=\frac{1}{2} C V^{2}
$$

Cop
$C=C_{1}+C_{2}+C_{3}$
Capacitors in series
$\frac{1}{C}=\frac{1}{C_{1}}+\frac{1}{C_{2}}+\frac{1}{C_{3}}$
Time constant for capacitor discharge

$$
=R C
$$

## Magnetic fields

| Force on a wire | $F=B I l$ |  |
| :--- | :--- | :--- |
| Magnetic flux density (Magnetic field strength) |  |  |
| in a long solenoid | $B=\mu_{0} n I \quad$ (Permeability of free space $\mu_{0}$ ) |  |
| near a long wire | $B=\mu_{0} I / 2 \pi r$ |  |
| Magnetic flux | $\Phi=B A$ |  |
| E.m.f. induced in a coil | $\mathcal{E}=-\frac{N \Delta \Phi}{\Delta t} \quad$ (Number of turns $N$ ) |  |

## Accelerators

| Mass-energy | $\Delta E=c^{2} \Delta m$ |
| :--- | ---: |
| Force on a moving charge | $F=B Q v$ |

## Analogies in physics

Capacitor discharge $\quad Q=Q_{0} \mathrm{e}^{-t / R C}$

Radioactive decay | $\frac{t_{\frac{1}{2}}}{R C}$ | $=\ln 2$ |
| ---: | :--- |
| $N$ | $=N_{0} \mathrm{e}^{-\lambda t}$ |
| $\lambda t_{\frac{1}{2}}$ | $=\ln 2$ |

## Experimental physics

$$
\text { Percentage uncertainty }=\frac{\text { Estimated uncertainty } \times 100 \%}{\text { Average value }}
$$

## Mathematics

Equation of a straight lin

$$
\begin{aligned}
\sin \left(90^{\circ}-\theta\right) & =\cos \theta \\
\ln \left(x^{n}\right) & =n \ln x \\
\ln \left(\mathrm{e}^{k x}\right) & =k x \\
y & =m x+c \\
\text { cylinder } & =2 \pi r h+2 \pi r^{2} \\
\text { sphere } & =4 \pi r^{2} \\
\text { cylinder } & =\pi r^{2} h \\
\text { sphere } & =\frac{4}{3} \pi r^{3} \\
\sin \theta & \approx \tan \theta \approx \theta \\
\cos \theta & \approx 1 \quad \quad \text { (in radians) }
\end{aligned}
$$

Surface area

Volume $\quad$ cylinder $=\pi r^{2} h$

For small angles:
