Question 6

- a. Consider the following paragraph.

Australian scientists in the forefront of medical research

Much research is taking place in Australia into the field of Proteomics. Proteomics is the large scale study of the proteins present in a living organism. The DNA of a cell provides the blueprint for the assembly of the primary structure of proteins, the large biomolecules essential to life. In humans, at any one time, there may be as many as 1 000 000 different proteins and it is those proteins that do all the real work such as providing structure to skin, digesting food and fighting infections. So significant is the role of proteins in living things that considerable resources are invested into identifying proteins as markers for disease.

- i. What is meant by the term 'markers for disease' in the above paragraph?

- ii. How does the primary structure of a protein differ from its secondary structure?

1 + 2 = 3 marks

Proteins are large molecules formed from the polymerisation of amino acids. All the amino acids in proteins are 2-amino acids (α -amino acids).

The students were instructed to use a clean dropper to place each of the two different samples of amino acid mixture onto the plate. One student accidentally used the same dropper for each sample without cleaning it between each use.

- d. State one way in which this student's final chromatogram would be different from a chromatogram that resulted from using the correct procedure.
