**Monday 10 June 2019**

Afternoon (Time: 50 minutes)

Paper Reference **31627H/1C**

**Applied Science**

**Unit 5: Principles and Applications of Science II**

**Chemistry**

**SECTION B: PROPERTIES AND USES OF SUBSTANCES**

**You will need:**

A calculator.

Total Marks

### Instructions

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and learner registration number.
- Answer **all** questions.
- Answer the questions in the spaces provided  
– *there may be more space than you need.*

### Information

- The exam comprises three papers worth 40 marks each.  
Section A: Organs and systems (Biology).  
Section B: Properties and uses of substances (Chemistry).  
Section C: Thermal physics, materials and fluids (Physics).
- The total mark for this exam is 120.
- The marks for **each** question are shown in brackets  
– *use this as a guide as to how much time to spend on each question.*
- The periodic table of elements can be found at the back of this paper.

### Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.

1/1/1/1/1/

Pearson

Answer ALL questions. Write your answers in the spaces provided.

Some questions must be answered with a cross in a box . If you change your mind about an answer, put a line through the box  and then mark your new answer with a cross .

- 1 Titanium is a transition metal.

Figure 1 shows a human hip with a titanium replacement implant.

Titanium is suitable for this use because it is very strong.

Figure 1

- (a) Give **one** other property that makes titanium suitable for this use.

(1)

- (b) Titanium can be extracted from its ore using the Kroll process.

The ore is first converted into titanium(IV) chloride.

It is then reduced to titanium in a furnace at temperatures of up to 1300 K.

- (i) Identify the substance used to reduce titanium(IV) chloride to titanium.

(1)

- A carbon
- B chlorine
- C iron
- D magnesium

(ii) The reduction of titanium(IV) chloride to titanium cannot be carried out in air.

The air has to be replaced with argon gas.

Explain why air needs to be replaced with argon gas for this reaction.

(2)

.....

.....

.....

.....

(iii) Another method that could be used to extract titanium from its ore is electrolysis.

Two advantages of electrolysis are that it is quicker and can be run continuously.

Give **two** other reasons why electrolysis would be a more efficient method of extraction than the Kroll process.

(2)

2 Pentane is an alkane that has the molecular formula  $C_5H_{12}$ .

(a) Identify the skeletal formula of pentane.

(1)

<b>A</b> 	<b>B</b> 
<b>C</b> 	<b>D</b> 

- A
- B
- C
- D

(b) Pentane burns in oxygen.

The process is exothermic.

(i) Name the type of reaction taking place when pentane burns in oxygen.

(1)

(ii) Explain how exothermic processes affect their surroundings.

(2)

(iii) The enthalpy change ( $\Delta H$ ) for this reaction is  $-3509 \text{ kJ}$  when one mole of pentane burns in oxygen.

The reaction is carried out at a pressure ( $p$ ) of  $100 \text{ kPa}$ .

The change in volume ( $\Delta V$ ) is  $0.21 \text{ m}^3$ .

Calculate the change in internal energy ( $\Delta U$ ) for this reaction.

$$\Delta H = \Delta U + p\Delta V$$

Show your working.

(3)

$\Delta U = \dots\dots\dots \text{ kJ}$

**(Total for Question 2 = 7 marks)**

3 The Contact process is used to make sulfur trioxide.

The equation for the Contact process is

(a) (i) This equation does not show the enthalpy change of formation of sulfur trioxide.

Give **one** reason why.

(1)

(ii) Identify the catalyst used in the Contact process.

(1)

- A aluminium oxide
- B iron(III) oxide
- C titanium(IV) oxide
- D vanadium(V) oxide

(b) Sulfuric acid,  $\text{H}_2\text{SO}_4$ , can be made by reacting sulfur trioxide with water.

Figure 2 shows a Hess energy cycle for the reaction of sulfur trioxide with water.

The values for the standard enthalpy change of formation ( $\text{kJ mol}^{-1}$ ) for sulfur trioxide, water and sulfuric acid are shown in Figure 2.

**Figure 2**

Calculate the value of  $\Delta H_r^\theta$  for the reaction of sulfur trioxide with water, using the standard enthalpy change values in Figure 2.

Show your working, using the Hess energy cycle or any other method.

(3)

$\Delta H_r^\theta = \dots\dots\dots \text{kJ mol}^{-1}$

- (c) Sulfuric acid is often used in organic chemistry and reacts with ethene by electrophilic addition.

Figure 3 shows an incomplete diagram of the stages in the electrophilic addition mechanism between ethene and sulfuric acid.

The dipoles, charges, lone pairs of electrons and some of the curly arrows are not shown in Figure 3.

Figure 3

- (i) Add the dipoles and curly arrows to the structures in Step 1 of Figure 3. (2)
- (ii) Add the charges and lone pair of electrons to Step 2 of Figure 3. (2)

(d) Calcium hydroxide,  $\text{Ca(OH)}_2$ , can be used to neutralise sulfuric acid effluent from factories. The neutralisation reaction forms water,  $\text{H}_2\text{O}$ , and one other product.

Complete and balance the chemical equation for the reaction of calcium hydroxide with sulfuric acid.

(State symbols are not required.)

4 Benzene is a hydrocarbon.

It had been suggested that the structure of benzene consists of double and single carbon-carbon bonds.

A suggested skeletal formula for benzene is shown in Figure 4.

Figure 4

(a) Explain the difference in bond length between a carbon-carbon double bond and a carbon-carbon single bond.

(3)

.....

.....

.....

.....

.....

.....

(b) Benzene has the molecular formula  $C_6H_6$ .

Explain, in terms of the general formula for alkenes, why benzene can **not** be an alkene.

(2)

(c) Figure 5 shows the actual skeletal structure for benzene.

Figure 5

Identify the bond angle for benzene.

(1)

- A 109.5°
- B 120°
- C 180°
- D 270°

(d) When carbon atoms bond with one another, their atomic orbitals are hybridised.

Carbon atoms in benzene show  $sp^2$  hybridisation.

Describe the process of  $sp^2$  hybridisation for a carbon atom.

(Total for Question 4 = 10 marks)

5 Alumina is aluminium oxide.

It is extracted from its ore bauxite, but must be separated from impurities that are acidic (such as silica) and basic (such as iron(III) oxide).

Explain how alumina is extracted and purified from bauxite.

You may include equations in your answer.

(6)

Area with horizontal dotted lines for writing the answer.
