<h1>Computing</h1> <h2>Unit 1: Principles of Computer Science</h2>											
Wednesday 17 May 2017 – Morning						Paper Reference				31768H	
Time: 2 hours											
You must have: Information Booklet (enclosed)								Total Marks			
								<input type="text"/>			

Instructions

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and learner registration number.
- Answer **all** questions.
- Answer the questions in the spaces provided
– *there may be more space than you need.*

Information

- The total mark for this paper is 90.
- The marks for **each** question are shown in brackets
– *use this as a guide as to how much time to spend on each question.*

Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.

1/1/1/1/1/1/1

Pearson

Answer ALL questions. Write your answers in the spaces provided.

Please refer to the Information Booklet in order to answer Question 1.

- 1 Rashida currently uses a paper-based system to manage a small independent gym. She wants a program to replace the paper-based system.

Section 1 of the Information Booklet contains information about the gym and the screen design for the new program.

The algorithm that calculates the member discount based on the member age is shown here.

- (a) Complete the logic for the control structures in the given pseudocode.

(3)

BEGIN

INPUT age

IF age ≥ 14 AND ≤ 16 :
Discount = 30%

age = 17 = 18:
Discount = 20%

ELIF age ≥ 50 :
Discount = 40%

: Discount = 0%

END

(b) The Python code shown has a variable called 'age'.

```
age = input ("Please Enter Your Age")
```

```
if age >= 14 and age <=16:
```

```
    Discount = 30
```

When 'age' is input by the user it is stored as a string data type.

Explain why the piece of code may require a string handling function.

2 Sally is currently investigating possible bank accounts for her savings. Sally would like a program that will help her choose which account will pay the most interest on her savings.

(a) The table shows three requirements for the program.

Identify a suitable built-in programming function that could be used to aid each requirement.

(3)

Program Requirements	Built-in Function
The amount of money to be saved needs to be entered.	
Only accept the first two digits entered for the interest rate.	
Only allow a number between 1 and 20 to be entered for the interest rate.	

Sally's requirements for the program are given in the table.

1	The number of bank accounts to be compared is entered and stored as a variable.
2	The money to be saved is entered and stored as a variable.
3	The interest rate is then entered and stored as a variable.
4	The interest is calculated by dividing the money to be saved by 100 and then multiplying this by the interest rate.
5	The total is calculated by adding the money to be saved to the interest.
6	The total is then output.
7	The program should loop for the entered number of bank accounts.

(b) The generated usernames will be stored in a list.

Describe how a linear search would check the list to ensure a username is unique.

(4)

(c) The program could be created using a procedural programming language.

Analyse how the structure of procedural programming, including statements, blocks and procedures, could be used when creating the program code.

(8)

Please refer to the Information Booklet in order to answer Question 4.

- 4 Richard owns a lift maintenance business. When work has been carried out, Richard tests the lift to ensure it is working correctly. He uses a program to keep these test logs organised.

Each lift has a target time that indicates the maximum amount of time a lift should take to travel from the ground floor to the top floor. If the actual time taken does not match the target time it could indicate that there is a problem.

- (a) **Figure 3a** shows the screen layout for the main menu. **Figure 3b** shows part of the programming code.

Identify **two** lines within the code in **Figure 3b** that contain an error and describe the error.

Information Booklet

Paper Reference

31768H

Instructions

- You will need the information in this booklet to answer some questions.
- Read the information carefully.
- You must **not** write your answers in this booklet.
- Only your answers given on the question paper booklet will be marked.

Turn over ►

1/1/1/1/1/1/1

Pearson

SECTION 1

The information in this section should be used to answer Question 1.

Figure 1a shows some information about the current system used by Rashida.

Membership

- When new members join, their personal details are entered into a paper-based folder and staff have to manually search this folder if member details need updating.
- Their membership expiry date is calculated manually and entered into the diary. Staff have to manually check when memberships are due to expire.
- When memberships expire, members must then return their membership cards as they could continue to access the gym's facilities without paying.

Types

- There are two types of membership, which allocate time restrictions when members can access the facilities.
- Occasionally members still gain access to the gym beyond their time restriction.

Discounts

- Some members receive a discount.
 1. Members who are **aged between 14 and 16** receive a 30% discount.
 2. Members who are **aged between 17 and 18** receive a 20% discount.
 3. Members who are **aged 50 and over** receive a 40% discount.
 4. All other members receive no discount.
- When the discount amount has been set, this is not updated automatically. This means that discounts are often applied incorrectly.

Figure 1a

Figure 1b shows a screen design for the new program for Rashida and example data.

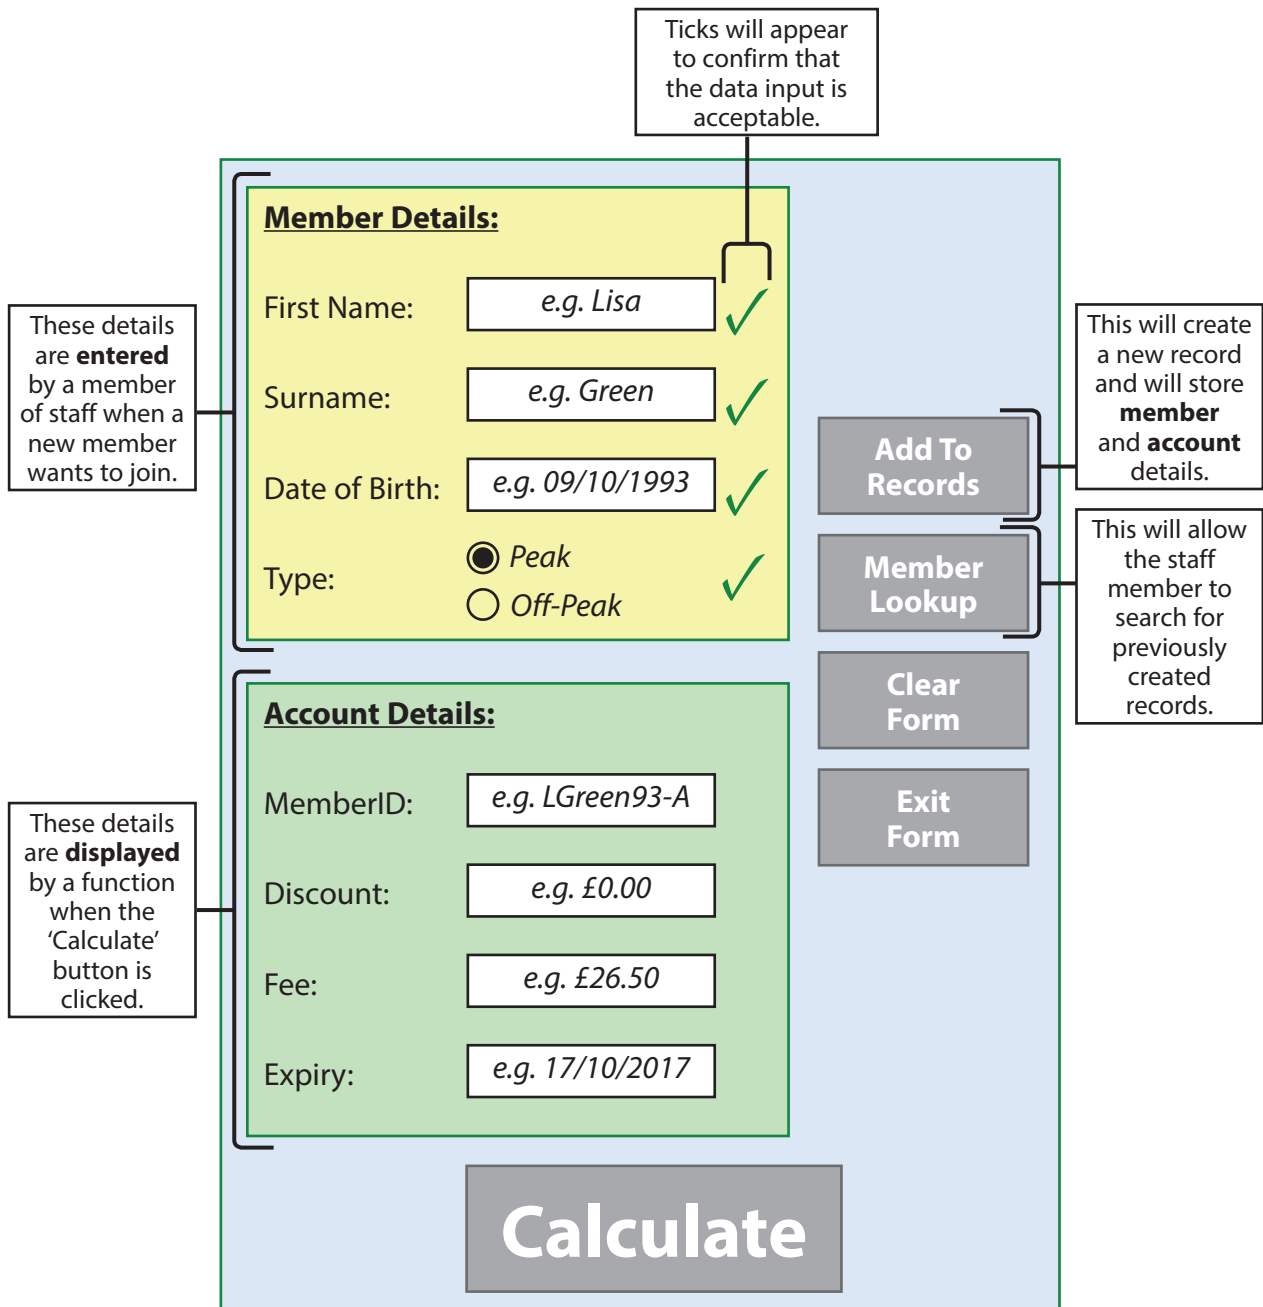

Figure 1b

SECTION 2

The information in this section should be used to answer Question 3.

Figure 2 shows the file that is used by the technician to create new usernames.

Figure 2

Rules for generating a new username

- A username must be made up from:
 1. The year they started (e.g. 2017)
 2. The first letter of their first name (e.g. A)
 3. Their surname (e.g. Cain)
 4. A number 1.
- If the username that has been created already exists then it must increase the number at the end of the username by one to make it unique. (e.g. 2017ACain2)
- The username should then be printed to the screen.

SECTION 3

The information in this section should be used to answer Question 4.

Figure 3a shows the main menu for the program used by Richard.

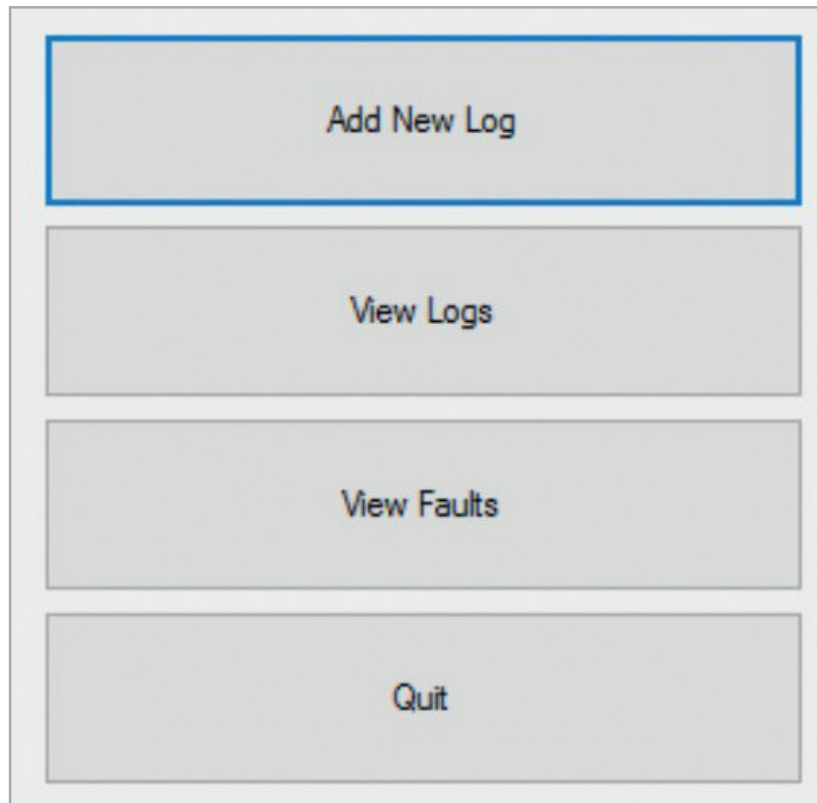

Figure 3a

Figure 3b shows the programming code for the main menu. It is written using C#.

```
55 }
56 void New_logClick(object sender, EventArgs e)
57 {
58     New_Log newLogForm = new New_Log();
59     newLogForm.Hide();
60 }
61 void View_logClick(object sender, EventArgs e)
62 {
63
64     View_Log viewLogForm = new View_Log();
65     viewLogForm.Show();
66 }
67 void View_faultsClick(object sender, EventArgs e)
68 {
69     View_Fault viewFaultForm = new View_Fault();
70     viewFaultForm.Show();
71 }
72 void QuitClick(object sender, EventArgs e)
73 {
74     Application.Run();
```

Figure 3b

Figure 3c shows the screen used by Richard to create a new test log.

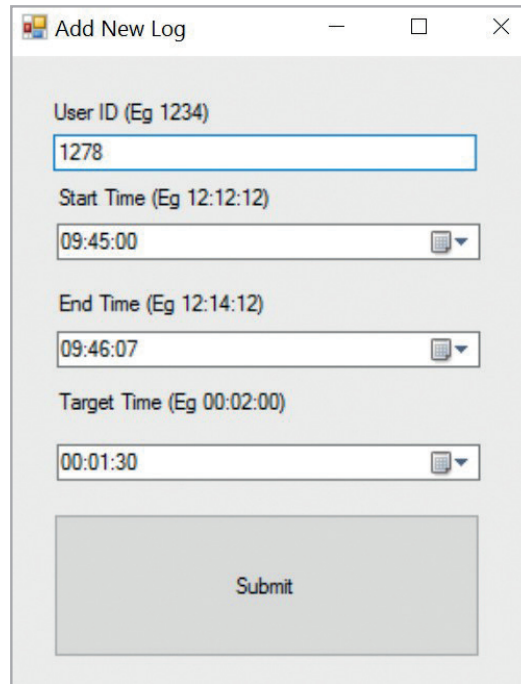

Figure 3c

Figure 3d shows the programming code used on the test log screen. It is written using C#.

```
1  using System;
2  using System.Drawing;
3  using System.Windows.Forms;
4  using System.IO;
5
6  namespace Lifttest_c_sharp
7  {
8      public partial class New_Log : Form
9      {
10         public New_Log()
11         {
12             InitializeComponent();
13         }
14         void SubmitClick(object sender, EventArgs e)
15         {
16             if (userid.Text != "" && ridename.Text != ""){
17
18                 string lineCount = File.ReadAllLines(@".\log.txt").Length.ToString();
19
20                 string logID = lineCount + userid.Text + starttime.Text + ","
21                     + endtime.Text + "," + targettime.Text + Environment.NewLine;
22
23                 File.AppendAllText(".\log.txt", log);
24
25                 TimeSpan start_time = TimeSpan.Parse(starttime.Text);
26                 TimeSpan end_time = TimeSpan.Parse(endtime.Text);
27                 TimeSpan target_time = TimeSpan.Parse(targettime.Text);
28                 TimeSpan time_taken = end_time - start_time;
29
30                 if(time_taken > target_time){
31
32                     MessageBox.Show("Time taken exceeds target time. A fault will be logged");
33
34                     string faultlog = logID + "," + userid.Text + "," + "," + starttime.Text + ","
35                         + endtime.Text + "," + targettime.Text + "," + "Maintenance Check" + Environment.NewLine;
36
37                     File.AppendAllText(".\fault.txt", faultlog);
38                 }
39                 this.Close();
40             } else {
41                 MessageBox.Show("Enter a valid User ID");
42             }
43         }
44     }
45 }
46
```
