# MARKSCHEME 

## November 2008

# MATHEMATICS SERIES AND DIFFERENTIAL EQUATIONS 

Higher Level

## Paper 3

This markscheme is confidential and for the exclusive use of examiners in this examination session.

It is the property of the International Baccalaureate and must not be reproduced or distributed to any other person without the authorization of IB Cardiff.

## Instructions to Examiners

## Abbreviations

M Marks awarded for attempting to use a correct Method; working must be seen.
(M) Marks awarded for Method; may be implied by correct subsequent working.

A Marks awarded for an Answer or for Accuracy; often dependent on preceding $\boldsymbol{M}$ marks.
(A) Marks awarded for an Answer or for Accuracy; may be implied by correct subsequent working.
$\boldsymbol{R} \quad$ Marks awarded for clear Reasoning.
$N \quad$ Marks awarded for correct answers if no working shown.
AG Answer given in the question and so no marks are awarded.

## Using the markscheme

## General

Write the marks in red on candidates' scripts, in the right hand margin.

- Show the breakdown of individual marks awarded using the abbreviations M1, A1, etc.
- Write down the total for each question (at the end of the question) and circle it.

## Method and Answer/Accuracy marks

- Do not automatically award full marks for a correct answer; all working must be checked, and marks awarded according to the markscheme.
- It is not possible to award $\boldsymbol{M} \mathbf{0}$ followed by $\boldsymbol{A 1}$, as $\boldsymbol{A}$ mark(s) depend on the preceding $\boldsymbol{M} \operatorname{mark}(\mathrm{s})$, if any.
- Where $\boldsymbol{M}$ and $\boldsymbol{A}$ marks are noted on the same line, e.g. M1A1, this usually means M1 for an attempt to use an appropriate method (e.g. substitution into a formula) and $\boldsymbol{A 1}$ for using the correct values.
- Where the markscheme specifies (M2), N3, etc., do not split the marks.
- Once a correct answer to a question or part-question is seen, ignore further working.

## $N$ marks

Award $\mathbf{N}$ marks for correct answers where there is no working.

- Do not award a mixture of $\boldsymbol{N}$ and other marks.
- There may be fewer $\boldsymbol{N}$ marks available than the total of $\boldsymbol{M}, \boldsymbol{A}$ and $\boldsymbol{R}$ marks; this is deliberate as it penalizes candidates for not following the instruction to show their working.

## Implied marks

Implied marks appear in brackets e.g. (M1), and can only be awarded if correct work is seen or if implied in subsequent working.

- Normally the correct work is seen or implied in the next line.
- Marks without brackets can only be awarded for work that is seen.

## Follow through marks

Follow through (FT) marks are awarded where an incorrect answer from one part of a question is used correctly in subsequent part(s). To award FT marks, there must be working present and not just a final answer based on an incorrect answer to a previous part.

- If the question becomes much simpler because of an error then use discretion to award fewer $\boldsymbol{F T}$ marks.
- If the error leads to an inappropriate value (e.g. $\sin \theta=1.5$ ), do not award the mark(s) for the final answer(s).
- Within a question part, once an error is made, no further dependent $\boldsymbol{A}$ marks can be awarded, but $\boldsymbol{M}$ marks may be awarded if appropriate.
- Exceptions to this rule will be explicitly noted on the markscheme.

## Mis-read

If a candidate incorrectly copies information from the question, this is a mis-read (MR). Apply a MR penalty of 1 mark to that question. Award the marks as usual and then write $-1(\mathbf{M R})$ next to the total. Subtract 1 mark from the total for the question. A candidate should be penalized only once for a particular mis-read.

- If the question becomes much simpler because of the $\boldsymbol{M R}$, then use discretion to award fewer marks.
- If the $\boldsymbol{M R}$ leads to an inappropriate value (e.g. $\sin \theta=1.5$ ), do not award the mark(s) for the final answer(s).

## Discretionary marks (d)

An examiner uses discretion to award a mark on the rare occasions when the markscheme does not cover the work seen. The mark should be labelled (d) and a brief note written next to the mark explaining this decision.

## Alternative methods

Candidates will sometimes use methods other than those in the markscheme. Unless the question specifies a method, other correct methods should be marked in line with the markscheme. If in doubt, contact your team leader for advice.

- Alternative methods for complete questions are indicated by METHOD 1, METHOD 2, etc.
- Alternative solutions for part-questions are indicated by EITHER . . . OR.
- Where possible, alignment will also be used to assist examiners in identifying where these alternatives start and finish.

## Alternative forms

Unless the question specifies otherwise, accept equivalent forms.

- As this is an international examination, accept all alternative forms of notation.
- In the markscheme, equivalent numerical and algebraic forms will generally be written in brackets immediately following the answer.
- In the markscheme, simplified answers, (which candidates often do not write in examinations), will generally appear in brackets. Marks should be awarded for either the form preceding the bracket or the form in brackets (if it is seen).
Example: for differentiating $f(x)=2 \sin (5 x-3)$, the markscheme gives:

$$
f^{\prime}(x)=(2 \cos (5 x-3)) 5 \quad(=10 \cos (5 x-3))
$$

Award $\boldsymbol{A 1}$ for $(2 \cos (5 x-3)) 5$, even if $10 \cos (5 x-3)$ is not seen.

## Accuracy of Answers

If the level of accuracy is specified in the question, a mark will be allocated for giving the answer to the required accuracy.

- Rounding errors: only applies to final answers not to intermediate steps.
- Level of accuracy: when this is not specified in the question the general rule applies: unless otherwise stated in the question all numerical answers must be given exactly or correct to three significant figures.

Candidates should be penalized once only IN THE PAPER for an accuracy error (AP). Award the marks as usual then write (AP) against the answer. On the front cover write $-1(\mathbf{A P})$. Deduct 1 mark from the total for the paper, not the question.

- If a final correct answer is incorrectly rounded, apply the $\boldsymbol{A P}$.
- If the level of accuracy is not specified in the question, apply the $\boldsymbol{A P}$ for correct answers not given to three significant figures.

If there is no working shown, and answers are given to the correct two significant figures, apply the $\boldsymbol{A P}$. However, do not accept answers to one significant figure without working.

## Crossed out work

If a candidate has drawn a line through work on their examination script, or in some other way crossed out their work, do not award any marks for that work.

1. (a) EITHER
use the substitution $y=v x$
$\frac{\mathrm{d} v}{\mathrm{~d} x} x+v=v+1$
M1A1
$\int \mathrm{d} v=\int \frac{\mathrm{d} x}{x}$
by integration
$v=\frac{y}{x}=\ln x+c$
A1

## OR

the equation can be rearranged as first order linear
$\frac{\mathrm{d} y}{\mathrm{~d} x}-\frac{1}{x} y=1$
M1
the integrating factor $I$ is
$\mathrm{e}^{\int-\frac{1}{x} \mathrm{dx}}=\mathrm{e}^{-\ln x}=\frac{1}{x}$
multiplying by $I$ gives

$$
\begin{aligned}
& \frac{\mathrm{d}}{\mathrm{~d} x}\left(\frac{1}{x} y\right)=\frac{1}{x} \\
& \frac{1}{x} y=\ln x+c
\end{aligned}
$$

## THEN

the condition gives $c=-1$
M1A1
so the solution is $y=x(\ln x-1)$
(b) (i) $\quad f^{\prime}(x)=\ln x-1+1=\ln x$

$$
f^{\prime \prime}(x)=\frac{1}{x}
$$

$$
f^{\prime \prime \prime}(x)=-\frac{1}{x^{2}}
$$

(ii) the Taylor series about $x=1$ starts

$$
\begin{align*}
f(x) & \approx f(1)+f^{\prime}(1)(x-1)+f^{\prime \prime}(1) \frac{(x-1)^{2}}{2!}+f^{\prime \prime \prime}(1) \frac{(x-1)^{3}}{3!}  \tag{M1}\\
& =-1+\frac{(x-1)^{2}}{2!}-\frac{(x-1)^{3}}{3!}
\end{align*}
$$

2. (a) (i) the integrand is non-singular on the domain if $p>-1$
with the latter assumed, consider

$$
\begin{aligned}
\int_{1}^{R} \frac{1}{x(x+p)} \mathrm{d} x & =\frac{1}{p} \int_{1}^{R} \frac{1}{x}-\frac{1}{x+p} \mathrm{~d} x \\
& =\frac{1}{p}\left[\ln \left(\frac{x}{x+p}\right)\right]_{1}^{R}, p \neq 0
\end{aligned}
$$

this evaluates to
$\frac{1}{p}\left(\ln \frac{R}{R+p}-\ln \frac{1}{1+p}\right), p \neq 0$
$\rightarrow \frac{1}{p} \ln (1+p)$
because $\frac{R}{R+p} \rightarrow 1$ as $R \rightarrow \infty$ R1
hence the integral is convergent AG
(ii) the given series is $\sum_{n=1}^{\infty} f(n), f(n)=\frac{1}{n(n-0.5)}$
the integral test and $p=-0.5$ in (i) establishes the convergence of the series
(b) (i) as we have a series of positive terms we can apply the comparison test, limit form
comparing with $\sum_{n=1}^{\infty} \frac{1}{n^{2}}$
$\lim _{n \rightarrow \infty} \frac{\sin \left(\frac{1}{n(n+3)}\right)}{\frac{1}{n^{2}}}=1$
as $\sin \theta \approx \theta$ for small $\theta$
and $\frac{n^{2}}{n(n+3)} \rightarrow 1$
(so as the limit (of 1 ) is finite and non-zero, both series exhibit the same behavior) $\sum_{n=1}^{\infty} \frac{1}{n^{2}}$ converges, so this series converges

Question 2(b) continued
(ii) the general term is

$$
\begin{array}{ll}
\sqrt{\frac{1}{n(n+1)}} & \text { A1 } \\
\sqrt{\frac{1}{n(n+1)}}>\sqrt{\frac{1}{(n+1)(n+1)}} & \text { M1 } \\
\sqrt{\frac{1}{(n+1)(n+1)}}=\frac{1}{n+1} & \boldsymbol{A 1}
\end{array}
$$

the harmonic series diverges
so by the comparison test so does the given series
3.
(a)

$$
\begin{aligned}
f(x) & =(1+a x)(1+b x)^{-1} \\
& =(1+a x)\left(1-b x+\ldots(-1)^{n} b^{n} x^{n}+\ldots\right.
\end{aligned}
$$

it follows that

$$
\begin{aligned}
c_{n} & =(-1)^{n} b^{n}+(-1)^{n-1} a b^{n-1} & \text { M1A1 } \\
& =(-b)^{n-1}(a-b) & \text { AG }
\end{aligned}
$$

(ii) $\mathrm{R}=\frac{1}{|b|}$
(b) to agree up to quadratic terms requires

$$
1=-b+a, \frac{1}{2}=b^{2}-a b
$$

M1A1A1
from which $a=-b=\frac{1}{2}$
(c) $\mathrm{e}^{\mathrm{x}} \approx \frac{1+0.5 x}{1-0.5 x}$

A1
putting $x=\frac{1}{3}$
M1

$$
\mathrm{e}^{\frac{1}{3}} \approx \frac{\left(1+\frac{1}{6}\right)}{\left(1-\frac{1}{6}\right)}=\frac{7}{5}
$$

4. (a) this separable equation has general solution

$$
\begin{aligned}
& \int \sec ^{2} y \mathrm{~d} y=\int \cos x \mathrm{~d} x \\
& \tan y=\sin x+c \\
& \text { the condition gives } \\
& \tan \frac{\pi}{4}=\sin \pi+c \Rightarrow c=1 \\
& \text { the solution is } \tan y=1+\sin x \\
& y=\arctan (1+\sin x)
\end{aligned}
$$

(b) the limit cannot exist unless $a=\arctan \left(1+\sin \frac{\pi}{2}\right)=\arctan 2$
in that case the limit can be evaluated using l'Hopital's rule (twice)
limit is

$$
\lim _{x \rightarrow \frac{\pi}{2}} \frac{(\arctan (1+\sin x))^{\prime}}{2\left(x-\frac{\pi}{2}\right)}=\lim _{x \rightarrow \frac{\pi}{2}} \frac{y^{\prime}}{2\left(x-\frac{\pi}{2}\right)}
$$

where $y$ is the solution of the differential equation the numerator has zero limit (from the factor $\cos x$ in the differential equation) so required limit is

$$
\lim _{x \rightarrow \frac{\pi}{2}} \frac{y^{\prime \prime}}{2}
$$

finally,

$$
\begin{array}{lr}
\qquad y^{\prime \prime}=-\sin x \cos ^{2} y-2 \cos x \cos y \sin y \times y^{\prime}(x) & \text { M1A1 } \\
\text { since } \cos y\left(\frac{\pi}{2}\right)=\frac{1}{\sqrt{5}} & \text { A1 } \\
\qquad y^{\prime \prime}=-\frac{1}{5} \text { at } x=\frac{\pi}{2} & \text { A1 } \\
\text { the required limit is }-\frac{1}{10} & \mathbf{A 1}
\end{array}
$$
