

	UNIVERSITY OF CAMBRIDGE INTERNATIONAL EXAMINATIONS International General Certificate of Secondary Education	2
CANDIDATE NAME		
CENTRE NUMBER	CANDIDATE NUMBER	
CHEMISTRY	0620/61	
Paper 6 Alterna	ative to Practical October/November 2012	

Candidates answer on the Question Paper.

No Additional Materials are required.

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in. Write in dark blue or black pen. You may use a pencil for any diagrams, graphs or rough working. Do not use staples, paper clips, highlighters, glue or correction fluid. DO NOT WRITE IN ANY BARCODES.

Answer all questions.

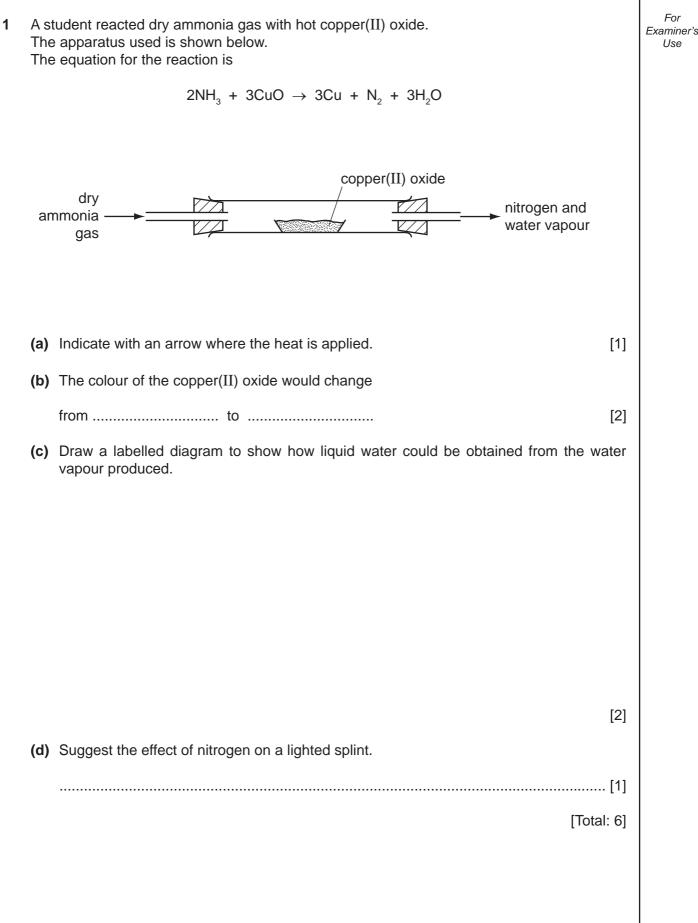

At the end of the examination, fasten all your work securely together. The number of marks is given in brackets [] at the end of each question or part question.

2 Electricity was passed through aqueous copper(II) sulfate using inert electrodes as shown in the diagram below.

Copper was deposited at one of the electrodes.

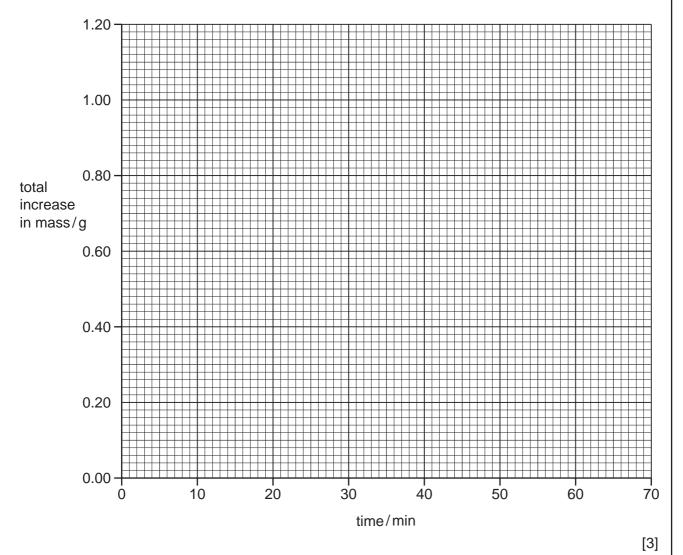

For

Examiner's

Table of results

time/min	mass of electrode/g	total increase in mass/g
0	3.75	0.00
10	4.00	0.25
20	4.25	0.50
30	4.50	
40	4.75	
50	4.90	
60	4.90	
70	4.90	

- (e) Complete the table by calculating the total increase in mass for the remaining time intervals. [1]
- (f) Plot the points on the grid below. Draw a graph with two intersecting straight lines.

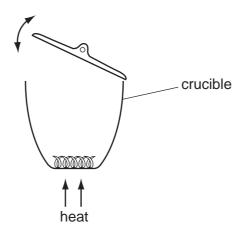

(g)	Suggest why the last three readings were the same.	For Examiner's Use
	[1]	
	[Total: 10]	

For

3 A student carried out an experiment to find the mass of magnesium oxide formed when magnesium burns in air.

A strip of magnesium ribbon was loosely coiled and placed in a weighed crucible, which was then reweighed.

The crucible was heated strongly for several minutes. During the heating, the crucible lid was lifted and replaced several times as in the diagram below.

The magnesium was converted into magnesium oxide. After cooling, the crucible and contents were reweighed.

(a)	Des	scribe the appearance of the
	(i)	magnesium[1]
	(ii)	magnesium oxide[1]
(b)	Nar	ne the element that reacted with the magnesium.
(c)	Wh	y was the lid lifted during heating?
(d)	Sug	gest why the mass of the magnesium oxide was found to be lower than expected.
		[Total: 6]

4 A student investigated the speed of reaction when iodine was produced by the reaction of solution L with potassium iodide at different temperatures.

Five experiments were carried out.

Experiment 1

A burette was filled with the aqueous solution L to the 0.0 cm³ mark. 10.0 cm³ of solution L was added from the burette into a boiling tube and the initial temperature of the solution was measured.

Using a measuring cylinder, 5 cm³ of aqueous potassium iodide and 3 cm³ of aqueous sodium thiosulfate were poured into a second boiling tube. Starch solution was added to this boiling tube and the mixture shaken.

The mixture in the second boiling tube was added to the solution L, shaken and the clock started. These chemicals reacted to form iodine which reacted with the starch. When a blue colour appeared, the clock was stopped and the time measured and recorded in the table. The final temperature of the mixture was measured.

Experiment 2

Experiment 1 was repeated but solution **L** was heated to about 40 °C. The temperature of the solution was measured before adding the mixture in the second boiling tube. When a blue colour appeared, the clock was stopped and the time measured and recorded in the table. The final temperature of the mixture was measured.

Experiment 3

Experiment 2 was repeated, heating solution L to about 50 °C.

Experiment 4

Experiment 2 was repeated, heating solution L to about 60 °C.

Experiment 5

Experiment 2 was repeated, heating solution L to about 70 °C.

experiment	thermometer diagram	initial temperature /°C	thermometer diagram	final temperature /°C	average temperature /°C	time/s
1	30 25 -20		30 25 20			215
2	45 -40 -35		30 -25 -20			105
3						60
4			45 40 			40
5						35

[5]

(a) Use the thermometer diagrams in the table to record the temperatures and complete the

table.

(b) Plot the results on the grid below and draw a smooth line graph. Examiner's 250 200 -150 time/s 100 50 0 0 10 20 30 40 50 60 70 80 average temperature/°C [5] (c) From your graph, work out the time taken for the blue colour to appear if solution L was heated to 80 °C. The final temperature of the reaction mixture was 64 °C. Show clearly on the grid how you obtained your answer. (d) Suggest the purpose of the starch solution in the experiments.[1] (e) (i) In which experiment was the reaction speed fastest?[1] (ii) Explain, using ideas about particles, why this experiment was the fastest.

9

For

(f)	Predict the effect on the time and speed of the reaction in Experiment 5 if it was repeated using a less concentrated solution of L .	For Examiner's Use
	time	
	speed[2]	
(g)	Why was a burette used to measure solution ${f L}$ instead of a measuring cylinder?	
	[1]	
	[Total: 19]	

I

A mixture of two solids, M and N, was analysed.
Solid M was zinc sulfate which is water-soluble and solid N was insoluble.
The tests on the mixture, and some of the observations, are in the table.
Complete the observations in the table.

		tests	observations
Distilled water was added to the mixture in a boiling tube and shaken. The contents of the tube were filtered and the filtrate and residue kept for the following tests.		tube and shaken. The contents of the are filtered and the filtrate and residue	
		<u>the filtrate</u> ate was divided into four portions.	
(a)	(i) (ii)	Drops of aqueous sodium hydroxide were added to the first portion of the filtrate. Excess aqueous sodium hydroxide was then added. Drops of aqueous ammonia were added to the second portion of the filtrate. Excess aqueous ammonia was then added.	[3]
(b)	by :	but 1 cm ³ of dilute nitric acid followed silver nitrate solution was added to the d portion of the filtrate.	[1]
(c)	bar	but 1 cm ³ of dilute nitric acid followed by ium nitrate solution was added to the rth portion of the filtrate.	[2]

tests	observations	For Examiner
tests on the residue		Use
(d) Appearance of the residue.	black solid	
(e) Dilute hydrochloric acid was added to a little of the residue. The mixture was heated and the gas given off was tested with damp blue litmus paper.	effervescence pungent gas, bleached litmus paper	
(f) Aqueous hydrogen peroxide was added to a little of the residue. The gas given off was tested.	effervescence glowing splint relit	
(g) Identify the gas given off in test (e).	J	
(h) Identify the gas given off in test (f).	[1]	
(i) What conclusions can you draw about s	solid N?	
	[2]	
	[Total: 12]	

Calcium carbonate is found in limestone and in marble. All carbonates react with hydrochloric acid to form chlorides. Calcium carbonate is insoluble in water but calcium chloride is water soluble.

Most impurities in limestone and marble are insoluble.

Plan an experiment to find out which of limestone and marble contain most insoluble impurities. You are provided with common laboratory apparatus.
