To determine the student's final examination score, you must first ascertain the student's scaled score using both methods described below. The student's final scaled score is the higher of the two.

**Method A:** Use the original score conversion chart and determine the final score using the total raw points the student earned, including any credits earned for questions 14 and 38.

**Method B:** Use the Spanish edition score conversion chart and determine the final score using the raw points the student earned, **excluding any credits earned for questions 14 and 38.**

All student answer papers that receive a scaled score of 60 through 64 **must** be scored a second time. For the second scoring, a different committee of teachers may score the student's paper or the original committee may score the paper, except that no teacher may score the same open-ended questions that he/she scored in the first rating of the paper.

Because scaled scores corresponding to raw scores in the conversion chart may change from one examination to another, it is crucial that for each administration, the conversion chart provided for that administration be used to determine the student's final score. The chart above is usable only for this administration of the Mathematics A examination.
