## Part One: General Marking Principles for Technological Studies Advanced Higher

This information is provided to help you understand the general principles you must apply when marking candidate responses to questions in this Paper. These principles must be read in conjunction with the specific Marking Instructions for each question.
(a) Marks for each candidate response must always be assigned in line with these general marking principles and the specific Marking Instructions for the relevant question. If a specific candidate response does not seem to be covered by either the principles or detailed Marking Instructions, and you are uncertain how to assess it, you must seek guidance from your Team Leader/Principal Assessor.
(b) Marking should always be positive ie, marks should be awarded for what is correct and not deducted for errors or omissions.

## GENERAL MARKING ADVICE: Technological Studies Advanced Higher

The marking schemes are written to assist in determining the "minimal acceptable answer" rather than listing every possible correct and incorrect answer. The following notes are offered to support Markers in making judgements on candidates' evidence, and apply to marking both end of unit assessments and course assessments.

## Q10

(a) Sub-system A: The voltage divider $\left(\mathrm{R}_{1}, \mathrm{R}_{2}\right.$ and $\left.\mathrm{R}_{\mathrm{f}}\right)$ provide a reference into the non-inverting input.
When non-inverting > inverting input, output is 5 V .
Rate of charge of capacitor determined by resistance of proximity sensor (frequency).
When inverting input > non-inverting, output goes low, capacitor discharges and device oscillates.
Soft Stop is caused by proximity sensor resistance increasing causing frequency to decrease.

Sub-system B: Sub-system A clocks the 4 D-types.
$\overline{\mathrm{Q}}$ from B causes a zero on D for two pulses, then two ' 1 's repeating.
Coils are energised by Q going high.

Any 8 points at 1 mark each
(b) Switch-off threshold $=3 \cdot 5 \mathrm{~V}$
