

AQA Level 3 Technical Level IT Communication technologies

Unit Number: H/507/6426

Specimen Question Paper

Time allowed: 2 hours

Instructions

- Use black ink or black ball-point pen
- Answer all questions
- You must answer the questions in the spaces provided. Do not write outside the box around each page or on blank pages
- Do all rough work in this book. Cross through any work you do not want to be marked

Information

- There are two sections to this paper
- Both sections should be attempted
- Learners should spend approximately 60 minutes on Section A and 60 minutes on Section B
- There are 80 marks available on this paper
- The marks for the questions are shown in brackets

Advice

Please read each question carefully before starting

Please write clearly, in block	capitals, to allow characte	r computer recognition.

Section A

Answer ALL questions in this section

0 1	Which of the following is not a network topology?	
	A Ring	0
	B Sieve	0
	C Bus	0
	D Line	0
		[1 mark]
0 2	State one main function of a DCE device:	[1 mark]
0 3	A transmission is found to have the following waveform:	
	State what type of signal this represents.	[1 mark]
0 4	The binary value 01010111 has been received by a device. It was even parity. Give one reason how you know this data has been corrupted due.	

0 5	Which transmission media is used in E	Bluetooth technology?	
	A Ethernet cable		
	B Infrared	0	
	C Radio waves	0	
	D Satellite microwaves	0	
		1	1 mark]
0 6	The following diagram shows three difficulty diagram by labelling each type, a), b) a	ferent types of data transmission. Compland c), correctly:	lete the
	a)		
	b)	$ \begin{array}{c} $	
	c)	$ \begin{array}{c} 1 & \xrightarrow{\text{TIME 1}} & 2 \\ \hline 1 & \xrightarrow{\text{TIME 2}} & 2 \end{array} $	
0 7	(a) State the difference between h transfers an audio signal.	ow a coaxial and an optical digital audio	marks] cable 1 mark]

] a)	Identify two different uses of HD quality video.
	[2 mar
b)	Compare and contrast the effectiveness of 3G and 4G technologies for distributi HD quality video.
	[4 mar

Section B

Answer ALL question(s) in this section

Read Item A and answer the questions on the following page:

Item A

Bandwidth (the amount of data that can be transmitted) is shared between everybody who is connected to the ISP's network, including businesses and home users. From the consumer perspective, the need for speed is greater than ever: 4G mobile phones, fibre optic broadband and cable speeds in cities now exceed 152Mbps. Yet in rural areas, limited by old technology in telephone exchanges, sparse populations and limited business infrastructure, the problem is different: due to low demand there is little capacity for the investment needed to expand.

The demand for data rises sharply every year because we are addicted to our Internet connected devices. ISPs are under pressure to provide a reliable, high-speed service at an affordable price. Some ISPs use traffic management to throttle connections at peak times. This is something consumers don't like, especially as ISPs bury this information in the small print.

The ISP has to strike a balance in their network allocation between making a profit and having so many users online at once that the connection slows to a trickle – which could mean losing hard-won customers. Some ISPs now guarantee a higher throughput – at a price. Customers who are prepared to pay extra can guarantee the speed of their connection at peak times.

When the network is busy, it's easy for things to get out of control. Some ISPs limit the amount of bandwidth used by protocols such as bit torrent to download files from the Internet – often large files, such as HD movies and commercial software. These users can quickly spoil the experience for other customers. Streaming services such as iPlayer, SkyGo and YouTube add a lot of traffic to the network. This costs the ISPs money.

The infrastructure between the telephone exchange and the ISP is called a 'backhaul connection'. It is similar to a large pipe that the smaller pipes flow into, relieving pressure on the network between the customer's house and the ISP. The most common sizes are 155Mbps and 622Mbps. It has to be bought or rented from a wholesale provider like BT and is hugely expensive. This is why an ISP provides packages with limits – such as capping – and "up to" speed packages. A 100Mbps backhaul might serve thousands of customers (or 'tails') but only if the network is managed effectively.

7

You are working as a Network Consultant for an ISP. Two customers have complained about the unreliable speed of their internet connection and are not happy with the response.

You have been asked to investigate and respond to the customers.

Item B

	Rural customer	Urban customer
Package	2Mbps broadband	8Mbps broadband
Capping	10GB monthly	Unlimited downloads
Throttling	At peak times	Bit torrent, peer-to-peer
Fibre available	No	Yes
Locality	Small village, 1,000 people	Manchester City Centre
Usage	iPlayer, Internet, email	Downloading software, movies

Using all the information in Items A and B:

(a)	Suggest two ways in which rural and urban customers could after the package or change their usage to improve their experience.	neir
	package of change their usage to improve their experience.	[4 marks]

(b)	Justify, from an ISP perspective, how bandwidth has been allocated on your
	network.

	(c)	Outline the relationship between a local area network, a wide area network and an Internet Service Provider (ISP).			
		[3 marks]			
1 8	comr	An international law firm has proposed a new system that would allow them to communicate directly with partners across the world on a 24/7 basis, to "enable the flow of funds and information between corporate headquarters and operating units in different countries".			
	histo and E	ell as being able to access documents for both current project management and rical cases, the system would allow client companies to sign legally binding US EU contracts from their inbox. It will also allow legal partners to attend meetings the other side of the world as if they were actually there.			
	(a)	State one way the law firm could identify one of their partner firm's desktop			
		computers on a network. [1 mark]			

Identify three remote working tools that could be used by the law firm an provide a benefit/advantage of how each of these remote working tools help the client companies achieve the goals outlined in the question.
[6

(c)	Outline the commercial risks faced from using the new system and exp steps that could be taken to minimise them.	nd explain the
