PAPER 48

QUANTUM FIELD THEORY

*Attempt **THREE** questions.*

*There are **FOUR** questions in total.*

The questions carry equal weight.

You may not start to read the questions printed on the subsequent pages until instructed to do so by the Invigilator.

1 Consider a free field theory with scalar fields $\phi^k (k = 1, 2)$ and Lagrangian density

$$\mathcal{L}_{\text{free}} = \frac{1}{2}\partial_\mu \phi^1 \partial^\mu \phi^1 + \frac{1}{2}\partial_\mu \phi^2 \partial^\mu \phi^2 - \frac{1}{2}m^2 \left((\phi^1)^2 + (\phi^2)^2\right).$$

Show that there is an internal symmetry generated by the infinitesimal variations

$$\phi^1 \to \phi^1 + \alpha\phi^2, \quad \phi^2 \to \phi^2 - \alpha\phi^1.$$

Using Noether's theorem, or otherwise, find the conserved charge Q associated with this symmetry.

Assuming now that the field theory is canonically quantized, express Q in terms of the fields ϕ^k and the conjugate momenta π^k. Using the expansions

$$\phi^k(\boldsymbol{x}) = \int \frac{d^3p}{(2\pi)^3} \frac{1}{\sqrt{2E_{\boldsymbol{p}}}} \left(a^k_{\boldsymbol{p}} + a^{k\dagger}_{-\boldsymbol{p}}\right) e^{i\boldsymbol{p}\cdot\boldsymbol{x}},$$

$$\pi^k(\boldsymbol{x}) = \int \frac{d^3p}{(2\pi)^3} (-i)\sqrt{\frac{E_{\boldsymbol{p}}}{2}} \left(a^k_{\boldsymbol{p}} - a^{k\dagger}_{-\boldsymbol{p}}\right) e^{i\boldsymbol{p}\cdot\boldsymbol{x}},$$

show that

$$Q = -i \int \frac{d^3p}{(2\pi)^3} \left(a^{2\dagger}_{\boldsymbol{p}} a^1_{\boldsymbol{p}} - a^{1\dagger}_{\boldsymbol{p}} a^2_{\boldsymbol{p}}\right).$$

Find a one-particle state that is an eigenstate of Q, and determine the eigenvalue.

Suppose the interaction terms

$$\mathcal{L}_{\text{int}} = -\lambda \left(\phi^1\right)^4 - 2\mu \left(\phi^1\right)^2 \left(\phi^2\right)^2 - \lambda \left(\phi^2\right)^4$$

are added to $\mathcal{L}_{\text{free}}$. What inequalities must λ and μ satisfy for there still to be a stable vacuum? For what values of λ and μ is Q still a conserved charge?

2 State the Feynman rules for particle scattering amplitudes in scalar ϕ^4 field theory, where the particles have rest mass m and the coupling constant is λ. Explain in outline how these rules are derived.

Draw a tree diagram (a diagram without loops) and a 1-loop diagram that contribute to the process where two incoming particles of 4-momenta p_1 and p_2 collide, and four outgoing particles of 4-momenta q_1, q_2, q_3 and q_4 are produced. What are the contributions to the scattering amplitude of these diagrams?

Suppose that one of the incoming particles has 3-momentum $\boldsymbol{p}$ and the other is at rest. What condition must $\boldsymbol{p}$ satisfy in order for it to be possible to have four outgoing particles?

3 Let Φ and ϕ be scalar Klein-Gordon fields, with Φ more than twice as massive as ϕ, and let the particles associated with these fields also be denoted by Φ and ϕ. Let ψ be a Dirac field of mass m.

Suppose the interaction terms in the Lagrangian density are

$$-G\overline{\psi}\psi\Phi - g\overline{\psi}\psi\phi$$

where G and g are real coupling constants. By considering the appropriate loop diagram, and Feynman rules, find the decay amplitude for $\Phi \to \phi + \phi$ to lowest order in G and g. Simplify as far as possible the traces of Dirac matrices that occur in your amplitude.

Suppose now that Φ is a pseudoscalar, rather than a scalar, and that the interaction terms are

$$iG\overline{\psi}\gamma^5\psi\Phi - g\overline{\psi}\psi\phi.$$

Find the field equation satisfied by ψ. By combining this with the equation satisfied by $\overline{\psi}$, determine the expression for the 4-divergence of the axial current $\overline{\psi}\gamma^\mu\gamma^5\psi$.

4 Write an essay on: Gauge invariance and its consequences in quantum electrodynamics.
