

## MATHEMATICAL TRIPOS Part III

Thursday 29 May 2003 1.30 to 4.30

## PAPER 11

## TOPOLOGICAL GROUPS

Attempt **THREE** questions.

There are **four** questions in total. The questions carry equal weight.

You may not start to read the questions printed on the subsequent pages until instructed to do so by the Invigilator. **1** Show that a topological group is metrisable with a left invariant metric if and only if it has a countable base of neighbourhoods at the identity. (Any properties of neighbourhoods that you need should be proved.)

Give, with proof, an example of a metrisable topological group which does not have a left and right invariant metric.

2 Show that any compactly generated, metrisable group has a Haar measure.

[You may assume the existence of functions with the properties needed by your proof.]

**3** Explain and prove the identification between group characters and the characters of Gelfand theory for  $L^1(G)$  where G is a locally compact Abelian Hausdorff group.

4 State and prove Bochner's theorem on positive definite functions. You may assume any elementary results on positive definite functions that you need.
