## M2PM3 SOLUTIONS 4. 19.2.2009

Q1. Triangle Lemma.
Draw the line joining $z_{1}$ and $z_{2}$, and produce it until it meets triangle $\Delta$ at points $Z_{1}, Z_{2}$ say. Then

$$
\left|z_{1}-z_{2}\right| \leq\left|Z_{1}-Z_{2}\right|,
$$

with equality iff both $z_{1}, z_{2}$ are on $\Delta$ rather than inside it (so $z_{1}=Z_{1}, z_{2}=Z_{2}$ ). There are two cases.
(i) $Z_{1}, Z_{2}$ lie on different sides of the triangle. Let $Z_{3}$ be the vertex in which these sides meet. Then by the Triangle Inequality,

$$
\left|Z_{1}-Z_{2}\right| \leq\left|Z_{1}-Z_{3}\right|+\left|Z_{2}-Z_{3}\right| \leq L_{1}+L_{2} \leq L
$$

where $L_{1}, L_{2}$ are the lengths of the sides containing $Z_{1}, Z_{2}$. Combining, $\left|z_{1}-z_{2}\right| \leq L$.
(ii) $Z_{1}, Z_{2}$ lie on the same side, of length $L_{12}$ say. Then

$$
\left|Z_{1}-Z_{2}\right| \leq L_{12} \leq L
$$

and the result follows as in (i).
Q2. Holomorphy and Conjugation.
As $f$ is holomorphic at $z_{0}, g(z):=f\left(z_{0}+z\right)$ is holomorphic at the origin. So

$$
\frac{g(h)-g(0)}{h} \rightarrow g^{\prime}(0)=f^{\prime}\left(z_{0}\right) \quad(h=k+i \ell \rightarrow 0)
$$

So replacing $\ell$ by $-\ell$,

$$
\frac{g(\bar{h})-g(0)}{\bar{h}} \rightarrow g^{\prime}(0)=f^{\prime}\left(z_{0}\right) \quad(h \rightarrow 0)
$$

So

$$
\frac{g(\bar{h})-g(0)}{h}=\frac{g(\bar{h})-g(0)}{\bar{h}} \cdot \frac{\bar{h}}{h} \sim g^{\prime}(0) \cdot \bar{h} / h \quad(h \rightarrow 0) .
$$

But $\bar{h} / h=(k-i \ell) /(k+i \ell)$. For $h$ real $(\ell=0)$ this is 1 ; for $h$ imaginary $(k=0)$ this is -1 . So this does not have a limit as $h \rightarrow 0$ (recall that this means $|h| \rightarrow 0$ : NO restriction on the argument of $h$ ). So $g(h)$ is not differentiable w.r.t. $\bar{h}$ at 0 . So $f(z)$ is not differentiable w.r.t. $\bar{z}$.

Q3. Union of Domains.
Suppose $\bigcup_{i} D_{i}=G \cup H$ with $G, H$ disjoint and open. We have to show one of $G, H$ is empty. Now

$$
D_{j}=\left(D_{j} \cap G\right) \cup\left(D_{j} \cap H\right)
$$

The union on the RHS is disjoint (as $G, H$ are), and the sets on RHS are open. As $D_{j}$ is connected, one of these sets must be empty: say, $D_{j} \cap H$ is empty,
i.e. $D_{j} \subset G$. Similarly, each $D_{k}$ is contained in one of $G, H$. But if $D_{k} \subset H$, $D_{j} \cap D_{k}$ non-empty contradicts $G \cap H$ empty. So all the $D_{k} \subset G$. So $H$ is empty.
Alternative Proof [assuming equivalence of connectedness and polygonal, or arcwise, connectedness].

Take $z_{0} \in \bigcap_{i} D_{i}$. We can join any point in any $D_{j}$ to $z_{0}$ by a path [e.g., a polygonal arc] lying in $D_{j}$, so in $\bigcup_{i} D_{i}$. So we can join any two points in $\bigcup_{i} D_{i}$ by such a path, by joining the paths linking each to $z_{0}$. So $\bigcup_{i} D_{i}$ is polygonally connected, so connected.

Q4 Connected Components.
Let $z$ be any point in $S$. Let $\left\{C_{i}\right\}$ be the class of all connected subsets of $S$ containing $z$. This class is non-empty (as $\{z\}$ is connected). By Q3, $C:=\bigcup_{i} C_{i}$ is a connected subset of $S$ containing $z$. By construction (as the union of all ...), $C$ is maximal. So $C$ is a component, and contains $z$. If $C^{\prime}$ is another component containing $z, C^{\prime}$ must be one of the $C_{i}$, so $C^{\prime} \subset C$. But $C^{\prime}$ is maximal (it is a component). So $C \subset C^{\prime}$, so $C=C^{\prime}$. So each point $z$ lies in a unique (connected) component, called the (connected) component containing z.

Q5. Write $a_{n}$ for the coefficient of $z^{n}$.
(i) $a_{n+1} / a_{n}=-n /(n+1)=-1 /(1+1 / n) \rightarrow-1$, so $\left|a_{n+1} / a_{n}\right| \rightarrow 1$. So by the Ratio Test, the radius of convergence is 1 . So the function is holomorphic in the unit disc $D:=\{z:|z|<1\}$.
Note. The sum function is $\log (1+z)$. This has a singularity at $z=-1$ (a branch point).
(ii) $a_{5 n}=1, a_{5 n+k}=0(k=1,2,3,4)$. $\limsup \left|a_{n}\right|^{1 / n}=1$. So the radius of convergence is 1 , and the region of holomorphy is again $D$.
Note. The sum function is $1 /\left(1-z^{5}\right)$. This has 5 singularities on the unit circle, at the 5 fifth roots of unity.
(iii) $a_{n}=1 / n^{n}, a_{n}^{1 / n}=1 / n \rightarrow 0$. So the radius of convergence is infinite. The sum function is holomorphic throughout the complex plane $\mathbf{C}$ (is an entire function, or an integral function).
