UNIVERSITY OF LONDON

INSTRUCTIONS TO CANDIDATES

1. In no circumstances may you remove answer books, used or unused, from the Examination Room.
2. Write on both sides of the paper.
3. Begin each answer on a fresh page.
4. Write the number of the question at the top of *each* page.
5. Do all rough work in the Answer Book and cross it through.
6. If you use supplementary books, tie them to the end of this book inside the cover. Do not write answers in a supplementary book until you have used all the pages in this book.
7. In any examination where the use of Electronic Calculators is permitted, the box at the top right-hand corner of this cover must be completed.
8. In the box below, enter the numbers and sub-sections of the questions in the order in which you have attempted them.

3, 1) - iii)

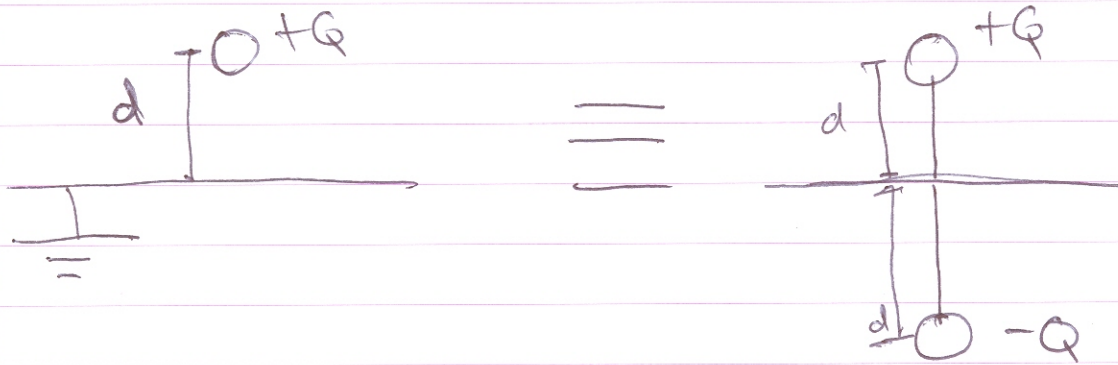

You are warned that the Examiners attach great importance to legibility, accuracy and clarity of expression.

For Examiner's use only	
Question No.	Mark
3	25 <i>FPP</i>
Total	25

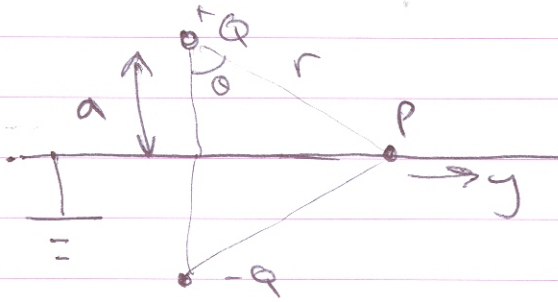

When a positive charge is opposite a grounded conducting plate the situation is equivalent to having a negative image charge opposite the plate at the same distance away

where?

negative

3^a

at point P

$$\cancel{E} \quad E_y = \frac{2Q}{4\pi\epsilon_0 r^2} \cos\theta$$

~~a~~

$$r^2 = a^2 + y^2$$

$$\cos\theta = \frac{a}{r}$$

$$E_y = \frac{Q}{2\pi\epsilon_0} \frac{a}{r^3}$$

$$= \frac{a}{(a^2 + y^2)^{3/2}}$$

$$= E_y = \frac{Q}{2\pi\epsilon_0} \frac{a}{(a^2 + y^2)^{3/2}}$$

$$E = \frac{Q}{\epsilon_0}$$

$$\therefore Q = E\epsilon_0 = \frac{Qa}{2\pi\epsilon_0(a^2 + y^2)^{3/2}}$$

86

$$E = \frac{Qa}{2\pi\epsilon_0 (a^2 + y^2)^{3/2}}$$

a) at 0 $y=0$

$$E = \frac{Q}{2\pi\epsilon_0 a^2}$$

$$E = \frac{100 \times 10^{-12}}{2\pi\epsilon_0 \times (3 \times 10^{-3})^2}$$

$$E = 199817.9 \text{ V/m}$$

~~$E =$~~ $E \approx 2 \times 10^5 \text{ V/m}$

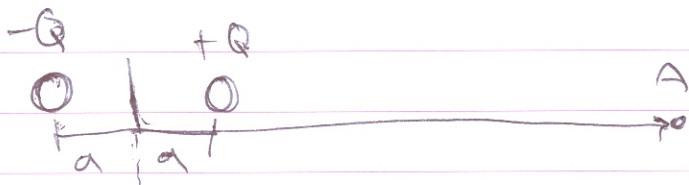

b) d at $y = 2 \times 10^{-3} \text{ m}$

$$d = \frac{100 \times 10^{-12} \times 3 \times 10^{-3}}{2\pi \times ((3 \times 10^{-3})^2 + (2 \times 10^{-3})^2)^{3/2}}$$

$$d = \frac{3 \times 10^{-20}}{2\pi \times 4.687 \times 10^{-8}}$$

$$\sigma = 1.02 \times 10^{-13} \text{ C m}^{-2}$$

c) at A

$$E \text{ at } Q = \frac{Q}{4\pi\epsilon_0} \left(\frac{1}{(A-a)^2} - \frac{1}{(A+a)^2} \right)$$

$$= \frac{Q}{4\pi\epsilon_0} \left(\frac{1}{(27 \times 10^{-3})^2} - \frac{1}{(33 \times 10^{-3})^2} \right)$$

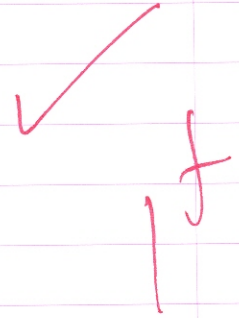

$$E = 407.75 \text{ Vm}^{-1}$$

$$E \approx 408 \text{ Vm}^{-1}$$

The E field points in the positive z direction.

✓
B cde

To The left of the plate the
field is zero.
