## INSTRUCTIONS TO CANDIDATES

- All questions are to be attempted. There are 18 pages of examinable material.
- Complete the written section of the examination paper in INK.
- Read each question carefully. Report the appropriate answer and show all relevant working in the space provided.
- The total score for this paper is 100 . The possible score per page is shown in the adjacent tables.
- Each new question of the short answer section begins with a $\bullet$.
- Electronic calculators, including programmable calculators, may be used. Students are warned, however, that credit may not be given, even for a correct answer, where there is insufficient evidence of the working required to obtain the solution.
- Numerical values required for any question, standard electrode reduction potentials, a Periodic Table and some useful formulas may be found on the separate data sheet.
- Pages 15, 17, 20, 23 and 24 are for rough working only.

- Many elemental metals crystallise in one of two forms, either with a cubic close packed (сср) structure or a hexagonal close packed (hcp) structure. What are the three main features that these two forms have in common and what is the main difference?
- Teeth are made from hydroxyapatite, $\mathrm{Ca}_{5}\left(\mathrm{PO}_{4}\right)_{3} \mathrm{OH}$. Use chemical equations where appropriate to explain why an acidic medium promotes tooth decay?

How does the fluoridation of drinking water aid in the prevention of tooth decay?

- Consider the compound with formula $\left[\mathrm{Ni}(\mathrm{en})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \mathrm{Br}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$. (en = ethylenediamine $=\mathrm{NH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{NH}_{2}$ ).

Write the formula of the complex ion.

Write the symbols of the ligand donor atoms.

What is the $d$ electron configuration of the metal ion in this complex?

- Describe the difference between a strong and a weak acid.

Describe in qualitative terms how the percentage ionisation of a weak acid changes when an aqueous solution of the weak acid is diluted.

Which chemical principle can be used to explain the change in percentage ionisation of a weak acid on dilution and how?

- Briefly describe two factors that determine whether a collision between two molecules will lead to a chemical reaction.

Briefly describe the relationship between the rate of a reaction and the activation energy for the reaction.

The rate constant for the decomposition of $\mathrm{N}_{2} \mathrm{O}_{5}$ increases from $1.50 \times 10^{-5} \mathrm{~s}^{-1}$ at $27^{\circ} \mathrm{C}$ to $3.80 \times 10^{-3} \mathrm{~s}^{-1}$ at $57^{\circ} \mathrm{C}$. Calculate the activation energy for the reaction.

- What is the pH of a 0.010 M solution of $\mathrm{Ca}(\mathrm{OH})_{2}$ ?

- What is the pH of a 0.010 M solution of $\mathrm{HNO}_{2}$ ? The $\mathrm{p} K_{\mathrm{a}}$ of $\mathrm{HNO}_{2}$ is 3.15 .
$\square$
- What is the pH of a solution that is 0.020 M in $\mathrm{CH}_{3} \mathrm{COOH}$ and 0.010 M in $\mathrm{CH}_{3} \mathrm{CO}_{2}^{-}$? The $K_{\mathrm{a}}$ of $\mathrm{CH}_{3} \mathrm{COOH}$ is $1.8 \times 10^{-5} \mathrm{M}$.
- Give the name of the starting material where indicated and the constitutional formula of the major organic product formed in each of the following reactions.
