## INSTRUCTIONS TO CANDIDATES

- All questions are to be attempted. There are 20 pages of examinable material.
- Complete the written section of the examination paper in INK.
- Read each question carefully. Report the appropriate answer and show all relevant working in the space provided.
- The total score for this paper is 100 . The possible score per page is shown in the adjacent tables.
- Each new question of the short answer section begins with a $\bullet$.
- Electronic calculators, including programmable calculators, may be used. Students are warned, however, that credit may not be given, even for a correct answer, where there is insufficient evidence of the working required to obtain the solution.
- Numerical values required for any question, standard electrode reduction potentials, a Periodic Table and some useful formulas may be found on the separate data sheet.
- Pages $18,21 \& 24$ are for rough working only.

- Briefly describe two factors that determine whether a collision between two molecules will lead to a chemical reaction.
$\square$
Briefly describe the relationship between the rate of a reaction and the activation energy for the reaction.
$\square$
The rate constant for the decomposition of $\mathrm{N}_{2} \mathrm{O}_{5}$ increases from $1.52 \times 10^{-5} \mathrm{~s}^{-1}$ at $25^{\circ} \mathrm{C}$ to $3.83 \times 10^{-3} \mathrm{~s}^{-1}$ at $45^{\circ} \mathrm{C}$. Calculate the activation energy for the reaction.
- Using equations, explain how a buffer functions.
$\square$
Why is the buffer most effective when $\mathrm{pH}=\mathrm{p} K_{\mathrm{a}}$ ?
$\square$
Why is it not possible to make a buffer using a strong acid and its conjugate base?
$\square$
What ratio of concentrations of acetic acid to sodium acetate would you require to prepare a buffer with $\mathrm{pH}=5.00$ ? The $\mathrm{p} K_{\mathrm{a}}$ of acetic acid is 4.76.

## ANSWER:

- Consider the compound with formula $\left[\mathrm{CoCl}_{2}\left(\mathrm{NH}_{3}\right)_{4}\right] \mathrm{Br} \cdot 2 \mathrm{H}_{2} \mathrm{O}$

Write the formula of the complex ion. $\square$
Write the symbols of the ligand donor atoms.

What is the $d$ electron configuration of the metal ion in this complex?

- Stalactites and stalagmites can be found in limestone caves near Sydney. Using chemical equations as part of your answer, explain how stalactites, stalagmites and the caves have been formed.
- A phase diagram of a pure compound has a triple point at $20^{\circ} \mathrm{C}$ and 0.25 atm , a normal melting point at $25^{\circ} \mathrm{C}$, and a normal boiling point at $87^{\circ} \mathrm{C}$.
Describe what happens when the pressure is reduced from 2 atm to 0.05 atm at a constant temperature of $15^{\circ} \mathrm{C}$ ?

Describe what happens when the temperature is raised from $13^{\circ} \mathrm{C}$ to $87^{\circ} \mathrm{C}$ at a constant pressure of 1.25 atm ?

Which is more dense, the solid or the liquid? Explain your reasoning.
